General Instructions

- Reading time – 5 minutes
- Working time – 2 hours
- Write using black pen.
- NESA approved calculators may be used.
- Commence each new question in a new booklet. Write on both sides of the paper.
- A reference sheet is provided.
- In Question 11-14 show relevant mathematical reasoning and/or calculations
- At the conclusion of the examination, bundle the booklets used in the correct order **including your reference sheet** within this paper and hand to examination supervisor.

Attempt Question 1 to 10

Allow approximately 15 minutes for this section

Mark your answers on the answer grid provided (labelled as page 11)

1. $\int \sin 2x \, dx =$

I $\sin^2 x + C$ where C is a constant

II $-\frac{1}{2} \cos 2x + D$ where D is a constant

III $-\cos^2 x + E$ where E is a constant

Which of above solutions is correct?

(A) II only

(B) I and II only

(C) II and III only

(D) I, II and III

2. In how many ways can a committee of 2 men and 3 women be selected from a group of 6 men and 8 women?

(A) ${}^6P_2 \times {}^8P_3$

(B) ${}^6C_2 \times {}^8C_2$

(C) ${}^6P_3 \times {}^8C_2$

(D) ${}^6C_2 \times {}^8C_3$

3. What are the solutions to the equation $e^{6x} - 7e^{3x} + 6 = 0$?
- (A) $x = 1$ and $x = 6$
- (B) $x = 0$ and $x = \frac{\log_e 6}{2}$
- (C) $x = 0$ and $x = \frac{\log_e 6}{3}$
- (D) 6
4. If P is the point $(-1, 2)$ and K is the point $(3, 5)$, the coordinates of the point that divides the interval PK externally in the ratio $2 : 3$ are:
- (A) $(11, 11)$
- (B) $\left(\frac{3}{5}, \frac{16}{5}\right)$
- (C) $(-3, -4)$
- (D) $(-9, -4)$

5.

$$\lim_{x \rightarrow 0} \frac{\sin \frac{3x}{2}}{6x} =$$

- (A) $\frac{1}{4}$
- (B) 4
- (C) $\frac{1}{2}$
- (D) 2

6. For the functions $f(x) = \frac{1}{x}$ and $g(x) = 2 \sin x$ the range of $g(f(x))$ is
- (A) $-1 \leq y \leq 1$
- (B) $\frac{1}{2} \leq y \leq \frac{1}{2}$
- (C) $-1 \leq y \leq 1$
- (D) $-2 \leq y \leq 2$
7. What is the exact value of $\tan \left(\cos^{-1} \left(\frac{\sqrt{3}}{2} \right) \right)$?
- (A) $\frac{1}{\sqrt{3}}$
- (B) $-\frac{1}{\sqrt{3}}$
- (C) $\sqrt{3}$
- (D) $-\sqrt{3}$
8. $\cos^{-1} [\cos(\cos^{-1}(-x))]$
- (A) $\pi - x$
- (B) $\pi - \cos^{-1} x$
- (C) $\cos^{-1} x$
- (D) $-\cos^{-1} x$
9. A parabola has the parametric equation $x = 6t$, $y = 3t^2$. The Cartesian equation of its derivative is:
- (A) $y' = 6t$
- (B) $y' = \frac{x^2}{12}$
- (C) $y' = \frac{x}{6}$
- (D) $y' = \frac{2x}{9}$

10. Find the value of x .

NOT TO SCALE

- (A) $x = 1$
- (B) $x = 2$
- (C) $x = 3$
- (D) $x = 4$

Attempt Questions 11 to 14

Allow approximately 1 hour and 45 minutes for this section.

Write your answers in the writing booklets supplied. Additional writing booklets are available.

Your responses should include relevant mathematical reasoning and/or calculations.

Question 11 (15 Marks)	Use a SEPARATE writing booklet	Marks
(a) Solve the inequality $\frac{5}{x-2} \leq 4$		3
(b) Use the substitution $u = x+2$ to evaluate $\int_1^3 \frac{x+1}{(x+2)^2} dx$ giving the answer in simplest exact form.		3
(c) The polynomial $P(x) = 2x^3 + bx^2 - 8x + 5$ has a remainder of 2 when divided by $(x+3)$, calculate the remainder when divided by $(x+2)$.		3
(d) i. Show that that $y = e^{-x} - 3x$ has only one real root.		1
ii. The root lies in the interval $0.2 < x < 0.3$ Taking $x_1 = 0.25$ as the first approximation, use one application of Newton's method to determine a better approximation. Give your answer correct to 3 significant figures.		2
(e) Using the word COWABUNGA		
i. How many arrangements of the 9 letters are possible?		1
ii. How many arrangements of the 9 letters are possible if the 3 letters COW have to be placed together? Note the letters COW can be placed in any order but they must be together.		2

Question 12 (15 Marks)

Use a SEPARATE writing booklet

Marks

- (a) The polynomial $P(x) = x^3 - 3x^2 + kx + 48$ has roots α, β and γ **3**

Two of the roots are equal in magnitude but opposite in sign. Find the third root and hence find the value of k .

- (b) A particle whose displacement is x moves in simple harmonic motion. Given that the displacement equation is of the form $x = a \cos(nt + \alpha)$ and $\ddot{x} = -4x$.

Initially the particle has displacement of $x = \sqrt{3}$ and velocity of $\dot{x} = 6$.

- i. Find the value of n . **1**

- ii. Find the displacement equation. **3**

- (c) Determine the domain and range of $y = \frac{1}{2} \sin^{-1}(1 - 3x)$ and hence sketch the graph. **3**

Question 12 continues on page 8

Question 12 (continued)

- (d) The points $P(2ap, ap^2)$ and $Q(2aq, aq^2)$ lie on the parabola $x^2 = 4ay$ as shown below.

The equation of the normal to the parabola at P is $x + py = 2ap + ap^3$.

The equation of the normal to the parabola at Q is $x + qy = 2aq + aq^3$.

- i. The equation of the chord PQ is $y = \frac{1}{2}(p+q)x - apq$. (DO NOT show this). If the chord passes through $(0, 5a)$ show that $pq = -5$. 1
- ii. Show that the point of intersection, R , of the normals at P and Q has the coordinates $[-apq(p+q), a(p^2 + pq + q^2 + 2)]$. 2
- iii. Find the equation of the locus of R if the chord PQ passes through $(0, 5a)$. 2

Question 13 (15 Marks)

Use a SEPARATE writing booklet

Marks

- (a) i. Show that $y = \frac{x^2 + x + 1}{x + 1} = x + \frac{1}{x + 1}$ **1**
- ii. Sketch the graph of the function, clearly showing all key features **3**

- (b) PS is a diameter of the circle PSQ . The tangents at P and Q meet at T . The tangent TQ and the diameter PS are produced to meet at R . Let $\angle SQR = \alpha$.

- i. Prove that $\angle TPQ = \frac{\pi}{2} - \alpha$. **2**
- ii. Prove that $\angle PTQ = 2\alpha$. **2**
- (c) The acceleration of a body A is given by $a = 18x(x^2 + 1)$ where x cm is the displacement after time t seconds. Initially, A starts from the origin with velocity 3 cm s^{-1} .
- i. Show that $v = 3(x^2 + 1)$. **2**
- ii. Find x in terms of t . **2**
- (d) By writing $\sqrt{3} \sin 3x - \cos 3x$ in the form $R \sin(3x - \alpha)$, where α is acute and $R > 0$, or otherwise, find the general solutions to the equation:

$$\sqrt{3} \sin 3x - \cos 3x = 0$$

Question 14 (15 Marks)

Use a SEPARATE writing booklet

Marks

- (a) A boy throws a ball with velocity $v \text{ ms}^{-1}$ at an angle of 45° to the horizontal.

- i. Derive expressions for the horizontal and vertical displacement of the ball from the point of projection. **2**
- ii. Show that the Cartesian equation of the path of the ball is **2**

$$y = x - \frac{gx^2}{v^2}$$

where g is the acceleration due to gravity.

- iii. A boy is standing on a hill inclined at θ to the horizontal as shown in the diagram below. He throws the ball at the same angle of elevation of 45° and at the same speed of $v \text{ ms}^{-1}$. If he can throw the ball 60 m down the hill but only 30 m up the hill, use the results in part ii. to show that $\theta = \tan^{-1}\left(\frac{1}{3}\right)$ **3**

- (b) The surface area of a spherical bubble is increasing at a constant rate of 1.9 mm^2 per second. Find the rate of increase of its volume when the radius is 0.6 mm . The volume of a sphere is given by $V = \frac{4}{3}\pi R^3$, and the surface area is given by $A = 4\pi R^2$. **3**

- (c) i. Using the expansions of $\cos(A + B)$ and $\cos(A - B)$, show that: **2**

$$\cos x - \cos(x + 2\theta) = 2 \sin(x + \theta) \sin \theta$$

- ii. Hence prove by mathematical induction that **3**

$$\sum_{r=1}^n \sin(2r-1)\theta = \frac{1 - \cos(2n\theta)}{2 \sin \theta}$$

Question was done well. There was no penalty if the solution was not graphed or tested

$$= \ln\left(\frac{5}{3}\right) - \frac{2}{15}$$

Common error was forgetting that $\int \frac{1}{u} du = \ln u$, and not changing the terminals

Many students lost a mark for not simplifying the last line

This question was done poorly. Students who graphed the function were successful.

Many students showed that $f'(x) < 0$ for all x and then stated that there were no turning points. This was not sufficient to show there is only 1 root, as there could be no roots. You must show that $f(x)$ changes sign as well.

Some students found the discriminant and showed that $\Delta < 0$. This is incorrect as the discriminant is only valid for quadratics.

(ii)

$$x_2 = 0.25 - \frac{[e^{-0.25} - 3(0.25)]}{[-e^{-0.25} - 3]}$$

$$= 0.2576....$$

$$= 0.258 \quad (2)$$

Done well. There was no penalty for incorrect rounding this time, but students need to take care.

Polynomials,

- a was very well done by most students
a few made minor errors, but most
got full marks.

S4M

- b many students had trouble with part ii

→ when you need to get the angle 'd'

it is easier to get 2 equations ① from x
and ② from x to get tan d, then get a.

→ many did $\frac{1}{2}v^2 = \int -4x dx$

this could enable them to get 'a' easily

but was more challenging to get d, as have to use $v=0, t=0$.

→ some integrated inverse trig functions doing way too much work for the marks.

Inverse Trig

- c most calculated the domain & range correctly
However, about 30% of students showed room
for improvement showing insufficient skills.

→ Many drew the graph incorrectly - this is a shame
as substituting $x=0$ would quickly confirm
where the graph lay.

Parametrics

- d i done very well

ii most did this question well, about 20% of
students need to revise their Parametrics work
on finding intersection of 2 points. students should
show $q^3 - p^3 = (q-p)(q^2 + qp + p^2)$ when breaking down
difference of 2 cubes, to ensure they get all marks.

iii about 40% of students struggled.

they need to remember the purpose is to eliminate

p and q → using $pq = -5$, $p+q = \frac{x}{5a}$
and $p^2 + q^2 = (p+q)^2 - 2pq$

$\angle TPS = \pi/2$ (tangent to a circle is perpendicular to the radius drawn to point of contact)

✓ ①

$\angle SQR = \angle SPQ = \alpha$ (angle between a tangent and a chord through the point of contact is equal to the angle in the alternate segment) ①

✓ ①

$$\therefore \angle TPQ = \pi/2 - \alpha$$

b) iii) In ΔTPQ

$TP = TQ$ (tangents to a circle from an external point are equal)

$\therefore \angle TPQ = \angle TQP$ (equal angles opposite equal sides in isosceles ΔTPQ)

$\therefore \angle PTQ = \pi - \left(\frac{\pi}{2} - \alpha + \frac{\pi}{2} - \alpha\right)$ (angle sum of $\Delta TPQ = \pi$)

$\therefore \angle PTQ = 2\alpha$

$$\therefore \int \frac{d}{dx} \left(\frac{1}{2} v^2 \right) dx = \int 18x^3 + 18x dx$$

✓ ① must have $dx!$

$$\therefore v^2 = 9x^4 + 18x^2 + c$$

when $x=0, v=3 \rightarrow 9 = c$

$$\therefore v^2 = 9x^4 + 18x^2 + 9$$

$$v^2 = 9(x^4 + 2x^2 + 1) \\ = 9(x^2 + 1)^2$$

∴ The proposition is true for $n = k+1$.
The proposition is true for $n=1$ and if it is true
for $n=k$ then it is true for $n=k+1$.
Therefore by the method of mathematical induction,
it is true for all positive integers
