(b) (i) $y = \cos^{-1}(e^x)$

We need $-1 \leq e^x \leq 1 \quad \therefore e^x \leq 1 \quad \therefore x \leq 0$

$\therefore D: x \leq 0$

Since $x \leq 0$, $0 \leq y < \frac{\pi}{2}$ (as $e^x \rightarrow 0^+$ as $x \rightarrow -\infty$)

$\therefore R: 0 \leq y < \frac{\pi}{2}$

(ii)

$y = \cos^{-1}(e^x)$.
($y = \frac{\pi}{2}$ is asymptote).

(c) $3x^2 + y^2 - 2xy - 8x + 2 = 0$

$\therefore 6x + 2y \frac{dy}{dx} - 2y - 2x \frac{dy}{dx} - 8 = 0$

$\therefore \frac{dy}{dx} = \frac{8 - 6x + 2y}{2y - 2x} = \frac{4 - 3x + y}{y - x}$

Thus $\frac{4 - 3x + y}{y - x} = 2$

$\therefore 4 - 3x + y = 2y - 2x \quad \therefore y = 4 - x$

Sub. in curve equation:-

$3x^2 + 16 - 8x + x^2 - 8x + 2x^2 - 8x + 2 = 0$

$6x^2 - 24x + 18 = 0$

$x^2 - 4x + 3 = 0$

(d) $P(x) = x^4 - 2x^3 + 3x^2 - 4x + 1$

(i) $\alpha + \beta + \gamma + \delta = -(-2) = 2$

$(\alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta) = 3$

So $\alpha^2 + \beta^2 + \gamma^2 + \delta^2 = (\alpha + \beta + \gamma + \delta)^2 - 2(\alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta)$

$$= 2^2 - 2(3)$$

$$= -2$$

(ii) Since $\alpha^2 + \beta^2 + \gamma^2 + \delta^2 < 0$

$\therefore$ at least one of $\alpha, \beta, \gamma, \delta$ is non-real.

But since the coefficients of $P(x)$ are real, the conjugate of this non-real root is also a root. What of the remaining 2 roots?

We observe that $P(-1) = 1 + 2 + 3 + 4 + 1 = 11 > 0$

and $P(1) = 1 - 2 + 3 - 4 + 1 = -1 < 0$.

$\therefore$ Since $P(x)$ is continuous, and $P(-1)$ and $P(1)$ have opposite signs, $y = P(x)$ crosses the x axis $\therefore P(x)$ has a real root. But the remaining root must also be real, else it would have a conjugate that's a root. $\therefore$ exactly 2 real roots.

Q15 (a) $P(5p, \frac{5}{p})$, $Q(5q, \frac{5}{q})$; $p, q > 0$

$$(i) m_{PQ} = \frac{\frac{5}{q} - \frac{5}{p}}{5q - 5p} = -\frac{1}{pq}$$

$$\therefore PQ \text{ equation is } y - \frac{5}{p} = -\frac{1}{pq}(x - 5p)$$

$$\therefore pqy - 5q = -x + 5p$$

$$\therefore x + pqy = 5(p+q)$$

(ii) For tangent at P, let $q \rightarrow p$

$$\therefore x + p^2y = 5(2p)$$

$$\therefore x + p^2y = 10p$$

Likewise, tangent at Q is $x + q^2y = 10q$.

(iii) For R, solve tangents simultaneously:

$$y(p^2 - q^2) = 10(p - q)$$

$$\therefore \text{as } p \neq q, \quad y = \frac{10}{p+q}$$

$$\text{Thus } x = 10p - \frac{10p^2}{p+q} = \frac{10pq}{p+q}$$

$$\therefore R = \left(\frac{10pq}{p+q}, \frac{10}{p+q} \right)$$

(iv) PQ secant is $x + pqy = 5(p+q)$

$$\therefore \text{if goes thru } (15, 0), \quad 15 + 0 = 5(p+q)$$

$$\therefore p+q = 3$$

$$\text{Thus } R = \left(\frac{10pq}{3}, \frac{10}{3} \right)$$

$$\text{So locus is } y = \frac{10}{3}$$

But $x > 0$, since $pq > 0$, and since the intersection cannot occur inside the hyperbola, $\therefore x < 7.5$.

$$\therefore \text{Locus is } y = \frac{10}{3}, \quad 0 < x < 7.5$$

[Note: the tangent at $(7.5, \frac{10}{3})$ on H goes thru $(15, 0)$]

(b)

$$S = (ae, 0).$$

Since PQ is a focal chord, S lies on PQ.

$$\therefore m_{PS} = m_{PQ}$$

$$\therefore \frac{b \sin \theta - 0}{a \cos \theta - ae} = \frac{b \sin \theta - b \sin \phi}{a \cos \theta - a \cos \phi}$$

$$\therefore \frac{\cancel{b} \sin \theta}{\cancel{a} (\cos \theta - e)} = \frac{\cancel{b} (\sin \theta - \sin \phi)}{\cancel{a} (\cos \theta - \cos \phi)}$$

$$\begin{aligned} \therefore \cancel{\sin \theta \cos \theta} - \sin \theta \cos \phi \\ = \cancel{\cos \theta \sin \theta} - \cos \theta \sin \phi - e (\sin \theta - \sin \phi) \end{aligned}$$

$$\therefore -\sin \theta \cos \phi + \cos \theta \sin \phi = -e (\sin \theta - \sin \phi)$$

$$\therefore \sin \theta \cos \phi - \cos \theta \sin \phi = e (\sin \theta - \sin \phi)$$

$$\therefore \sin(\theta - \phi) = e (\sin \theta - \sin \phi)$$

$$\therefore e = \frac{\sin(\theta - \phi)}{\sin \theta - \sin \phi}, \text{ as required.}$$

[ALT. Equation of PQ is

$$y - b \sin \theta = \frac{b \sin \theta - b \sin \phi}{a \cos \theta - a \cos \phi} (x - a \cos \theta).$$

Sub. in $S(ae, 0)$, and rearrange correctly.]

Q15 - ctd.

(c) We have $T_n = 2T_{n-1} - 2T_{n-2}$, $n = 3, 4, 5, \dots$

and $T_1 = 2$, $T_2 = 0$. To prove: $T_n = (\sqrt{2})^{n+2} \cos \frac{n\pi}{4}$.

When $n=1$: $(\sqrt{2})^{1+2} \cos \frac{1(\pi)}{4} = 2\sqrt{2} \cdot \frac{1}{\sqrt{2}} = 2$

$\therefore$ true for $n=1$

When $n=2$: $(\sqrt{2})^{2+2} \cos \frac{2\pi}{4} = 4 \times 0 = 0$

$\therefore$ true for $n=2$

✓ proves for $n=1, 2$

Assume true for $n \leq k$

i.e. assume $T_n = (\sqrt{2})^{n+2} \cos \frac{n\pi}{4}$, $n = 1, 2, 3, \dots, k$.

Then look at $n = k+1$:

$$T_{k+1} = 2 \cdot T_k - 2 \cdot T_{k-1} \quad \text{by the recursive definition.}$$

$$= 2(\sqrt{2})^{k+2} \cos \frac{k\pi}{4} - 2(\sqrt{2})^{(k-1)+2} \cos \frac{(k-1)\pi}{4}$$

by our assumption.

$$= (\sqrt{2})^{k+3} \left[\sqrt{2} \cos \frac{k\pi}{4} - \cos \left(\frac{k\pi}{4} - \frac{\pi}{4} \right) \right]$$

$$= (\sqrt{2})^{k+3} \left[\frac{2}{\sqrt{2}} \cos \frac{k\pi}{4} - \left(\cos \frac{k\pi}{4} \cos \frac{\pi}{4} + \sin \frac{k\pi}{4} \sin \frac{\pi}{4} \right) \right]$$

$$= (\sqrt{2})^{k+3} \left[\frac{2}{\sqrt{2}} \cos \frac{k\pi}{4} - \frac{1}{\sqrt{2}} \cos \frac{k\pi}{4} - \frac{1}{\sqrt{2}} \sin \frac{k\pi}{4} \right]$$

$$= (\sqrt{2})^{k+3} \left[\frac{1}{\sqrt{2}} \cos \frac{k\pi}{4} - \frac{1}{\sqrt{2}} \sin \frac{k\pi}{4} \right]$$

$$= (\sqrt{2})^{k+3} \left[\cos \frac{\pi}{4} \cos \frac{k\pi}{4} - \sin \frac{\pi}{4} \sin \frac{k\pi}{4} \right]$$

$$= (\sqrt{2})^{k+3} \left[\cos \left(\frac{k\pi}{4} + \frac{\pi}{4} \right) \right]$$

$$\therefore T_{k+1} = (\sqrt{2})^{(k+1)+2} \cos \frac{(k+1)\pi}{4}$$

$\therefore$ if true for $n = 1, 2, \dots, k$ it's true for $n = k+1$.

Hence, by induction & (*), true for $n = 1, 2, 3, \dots$

✓ correct geometrical reason

$$T_D = T_F \quad (\text{given})$$

$\angle TDF = \angle CAD$ (angle between tangent and chord at point of contact equals angle in alternate segment)

$\therefore$ AEFD is cyclic (exterior angle equals interior opposite angle) #

$\angle PBA = \angle ADF$ (exterior angle of cyclic quad ABCD equals interior opposite angle)

$\therefore$ PBEA is cyclic (interval AP subtends equal angles at points E & B which are on the same side of AP). #

$$(c) \quad I_n = \int_0^1 (1-x^2)^n dx \quad \& \quad J_n = \int_0^1 x^2 (1-x^2)^n dx$$

$$(i) \quad I_n = \int_0^1 (1-x^2)^n \cdot \frac{d}{dx}(x) dx$$

$$= \left[x (1-x^2)^n \right]_0^1 - \int_0^1 -2nx^2 (1-x^2)^{n-1} dx$$

$$= 0 + 2n \int_0^1 x^2 (1-x^2)^{n-1} dx$$

$$\therefore I_n = 2n \cdot J_{n-1}$$

(ii) from (i),

$$I_n = 2n \int_0^1 x^2 (1-x^2)^{n-1} dx$$

(C) (iii)

$$J_n = \int_0^1 x^2 (1-x^2)^n dx$$

$$= - \int_0^1 [(1-x^2)-1] (1-x^2)^n dx$$

$$= - (I_{n+1} - I_n)$$

$$\therefore J_n = I_n - I_{n+1}$$

$$= I_n - \frac{2(n+1)}{2(n+1)+1} \cdot I_n \quad \text{from (ii)}$$
