(d) A particle of mass 10 kg is projected vertically upwards with a velocity 6

of $u \text{ m/s}$. The resistive force is one-tenth of the square of its velocity.

(ii) Hence, find the range of possible values for $\arg(z)$.

(c) (i) Find the values of A , B and C if 7

$$\frac{-1}{x^2(x+1)} = \frac{A}{x^2} + \frac{B}{x} + \frac{C}{x+1}.$$

(ii) A particle of unit mass moves on the x -axis against a resistance numerically equal to $v^2 + v^3$, where v is its velocity. Initially the particle is travelling with velocity u , where $u > 0$.

It can be proven that when the velocity is $\frac{u}{2}$ the distance X travelled by the particle is given by $X = \ln \left(\frac{2+u}{1+u} \right)$ (Do not prove this)

(α) Prove that if T is the time taken to travel the distance X then

$$u(T + X) = 1.$$

(β) It is alleged that if the particle started at the origin then the velocity v , displacement x , and time t are related by the equation $v = \frac{u}{ux+ut+1}$.

By finding a suitable derivative, show that this is in fact correct.

Section C (Use a SEPARATE writing booklet)

Question 5 (15 marks)

(a) (i) Write $(1 + i)^n$ in modulus argument form. 6

(iii) If n is a multiple of 8.

Show that $\binom{n}{1} + \binom{n}{5} + \binom{n}{9} + \dots = \binom{n}{3} + \binom{n}{7} + \binom{n}{11} + \dots$

(b) 9

A particle is projected at an angle of θ to the horizontal with velocity V . (Assume that there is no air resistance) and take gravity to be g . At time t , let x and y be the horizontal and vertical displacements respectively.

- (i) Derive the equations of motion in the horizontal and vertical directions in terms of t .
- (ii) It is known that at some time t during its flight, the x and y displacements of the particle are equal and the direction of motion is inclined at 45° to the downward vertical. The position of the particle at this time is marked P in the diagram above. Use this information to show that $\tan \theta = 3$.
- (iii) Hence, find the range of the particle in terms of V and g .
- (iv) If the speed of projection may be varied but the particle must not rise more than H above the ground. Find the maximum range in terms of H .

Q1. (a) $\int \frac{\cos x}{1+\sin x} dx$ Let $u = \sin x$
 $du = \cos x dx$
 $= \int \frac{du}{1+u}$
 $= \ln(1+u) + C$
 $= \ln(1+\sin x) + C$ ✓ (1)

(b) $\int \frac{\cos^2 x}{1+\sin x} dx$
 $= \int \frac{1-\sin^2 x}{1+\sin x} dx = \int \frac{(1-\sin x)(1+\sin x)}{1+\sin x} dx$ ✓
 $= \int (1-\sin x) dx$ (2)
 $= x + \cos x + C$ ✓

(c) $a = 3-4i$, $b = 1+i$.

(i) $b-a = -2+5i$ ✓

(ii) $ab = 7-i$ ✓ $\therefore \bar{ab} = \bar{7-i} = 7+i$ ✓ (5)

(iii) $\frac{a}{b} = \frac{3-4i}{1+i}$

$= \frac{3-4i}{1+i} \times \frac{1-i}{1-i}$ ✓

$= \frac{-1-7i}{1+1} = \frac{-1-7i}{2} = -\frac{1}{2} - \frac{7}{2}i$ ✓

1.(d) $P(x) = x^4 - x^3 - 2x^2 + 6x - 4$

(i) By the conjugate root theorem, if $P(x)$ has real coefficients and $(a+bi)$ is a root, then so is $(a-bi)$.
 $\therefore$ If $(1+i)$ is a zero so is $(1-i)$ since $P(x)$ has real coefficients. ✓

(ii) $(x-1-i)(x-1+i)$ is a factor of $P(x)$

$\Rightarrow (x^2-2x+2)$ is a factor ✓

By division $\begin{array}{r} x^2+x-2 \\ x^4-x^3-2x^2+6x-4 \\ \underline{x^4-2x^3+2x^2} \\ x^3-4x^2+6x \\ \underline{x^3-2x^2+2x} \\ -2x^2+4x-4 \\ \underline{-2x^2+4x-4} \\ 0 \end{array}$ (3)

for $q(x) = x^2+x-2 = (x+2)(x-1)$
 $x = \frac{-1 \pm \sqrt{1+8}}{2} = \frac{-1 \pm 3}{2}$
 $x = -2 \text{ or } 1$ ✓

$\therefore$ zeros of $P(x)$ are $x = -2, 1, (1+i), (1-i)$.

$$\text{For } (1+bx)^5, T_{r+1} = {}^5C_r (bx)^r$$

$$\therefore T_{r+1}(\text{of sum}) = {}^5C_r (a^r + b^r) x^r$$

$$\text{Coefficient of term in } x^1 = {}^5C_1(a+b) = 40$$

$$\therefore a+b = 8 \quad (1) \checkmark$$

$$\text{Coefficient of term in } x^2 = {}^5C_2(a^2+b^2) = 260$$

$$10(a^2+b^2) = 260$$

$$a^2+b^2 = 26 \quad (2) \checkmark$$

$$(ii) \text{ Now } (a+b)^2 = (a^2+b^2) + 2ab = 8^2 \checkmark$$

$$26 + 2ab = 64$$

from (2) and (1)

$$2ab = 38$$

$$ab = 19 \checkmark$$

$$(iii) \text{ Coefficient of } x^3 = {}^5C_3(a^3+b^3)$$

$$= 10(a+b)(a^2-ab+b^2)$$

$$= 10 \times 8 \times (26-19)$$

$$= 560 \checkmark$$

Q2. (a)

$$(i) y = f(|x|)$$

Sketch $y = f(x)$ for $x \geq 0$ only.
Then reflect in y.

$$(ii) |y| = f(x)$$

Discard section of $f(x)$ below x-axis.
Reflect leftover section in x=0.

$$(iii) y = \frac{1}{f(x)}$$

(1/2)

2(a)
(iv) $y = 2^{f(x)}$

x	-2	0	∞	$-\infty$
$f(x)$	0	2	1^+	$-\infty$
$y = 2^{f(x)}$	1	4	2^+	0^+

(b)

eg $A \rightarrow -2 + 3i = z$
 $|z| = \sqrt{4+9} = \sqrt{13}$

$B \rightarrow \bar{z} = -2 - 3i$

Q2(c) $\int \ln(1+x^2) dx$
 $= \int 1 \cdot \ln(1+x^2) dx$
parts $\int u dv = uv - \int v du$

where $u = \ln(1+x^2)$ $dv = 1$
 $du = \frac{2x}{1+x^2}$ $v = x$

$I = x \ln(1+x^2) - \int x \cdot \frac{2x}{1+x^2} dx$
 $= x \ln(1+x^2) - 2 \int \frac{x^2}{1+x^2} dx$
 $= x \ln(1+x^2) - 2 I_2$

Now $I_2 = \int \frac{x^2+1-1}{x^2+1} dx$
 $= \int 1 dx - \int \frac{1}{x^2+1} dx$
 $= x - \tan^{-1}x$

$\therefore I = x \ln(1+x^2) - 2(x - \tan^{-1}x) + C$

$I = x \ln(1+x^2) - 2x + 2 \tan^{-1}x + C$

(d) $\int_{-1}^1 (1+x^3)^3 dx$

$= \int_{-1}^1 (1 + 3x^3 + 3x^6 + x^9) dx$

$= \left[x + \frac{3x^4}{4} + \frac{3x^7}{7} + \frac{x^{10}}{10} \right]_{-1}^1$

$= \left(1 + \frac{3}{4} + \frac{3}{7} + \frac{1}{10} \right) - \left(-1 + \frac{3}{4} - \frac{3}{7} + \frac{1}{10} \right)$

Assume $P(\alpha) = 0$

$$\text{ie. } \left(\frac{n-1}{n}\right)^n - \left(\frac{n-1}{n}\right)^{n-1} - 1 = 0$$

$$\text{ie. } \left(\frac{n-1}{n}\right)^{n-1} \left[\frac{n-1}{n} - 1 \right] = 1$$

$$\left(\frac{n-1}{n}\right)^{n-1} \left(-\frac{1}{n} \right) = 1$$

This is impossible

$$\text{since } \left(\frac{n-1}{n}\right)^{n-1} > 0 \quad [n > 1]$$

$$\& -\frac{1}{n} < 0$$

$\therefore$ LHS is negative

$\therefore$ Contradiction

$$P(\alpha) \neq 0$$

$\therefore$ no repeated roots.

Q6 (b) (1) (a) $\frac{11!}{2! \times 2!} = \underline{9,979,200}$

(b) $\frac{9!}{2} \times 2 = \underline{362,880}$

(c) $\frac{9!}{2} = \underline{181,440}$

(d) $\frac{11!}{2! \times 2!} - \frac{10!}{2} - \frac{10!}{2} + 9! = \underline{6,713,280}$

(11) Look at cases.

$$7 \times \frac{5!}{2! \times 2!} + \binom{7}{2} \times \frac{5!}{2!} \times 2 + \binom{7}{3} \times \frac{5!}{2!} \times 2$$

$$+ \binom{7}{3} \times 5! + \binom{7}{4} \times 5! \times 2 + 7P_5$$

$$= 210 + 2520 + 420 + 420 + 840 + 2520$$

$$= \underline{22,050}$$
