$$\sin^2 x - 2\sin x - 1 = 0$$

- (c) Solve $\tan 2x = -\sqrt{3}$, for $-180^\circ \leq x \leq 180^\circ$.

2

$$-360^\circ \leq 2x \leq 360^\circ$$

$$2x = \tan^{-1}(-\sqrt{3})$$

$$120^\circ, 300^\circ$$

$$x = -30^\circ, -120^\circ, 60^\circ, 150^\circ$$

✓ for $-120^\circ, 150^\circ$

(d) Find the equation of the trigonometric graph below.

2

$$y = 2 \sin(n\pi), \quad (180^\circ, -2) \rightarrow -2 = 2 \sin(n \times 180^\circ)$$

$$-1 = \sin(n \times 180^\circ)$$

$$n \times 180^\circ = \sin^{-1}(-1)$$

Alternatively,

$$3 \times \text{period} = 720^\circ$$

$$\text{period} = 240^\circ$$

$$\frac{2 \times 180^\circ}{n} = 240^\circ$$

$$\frac{3}{2} = n$$

$$= 270^\circ$$

$$n = \frac{3}{2}$$

$$\therefore y = 2 \sin\left(\frac{3}{2}x\right)$$

- (e) Three points W, X and Y lie on a straight path on the ground, where $WX = XY = 40$ m. The base, B , of a flagpole, TB , is on the same horizontal plane as the path. M is the midpoint of WX . The angles of elevation to the top of the flagpole from the points W, X and Y are α, α , and β respectively. The height of the flagpole is h .

- i. Prove that $\triangle BWX$ is isosceles.

2

In $\triangle TBW$, $\tan \alpha = \frac{h}{BW} \rightarrow BW = h \cot \alpha$

In $\triangle TBX$, $\tan \alpha = \frac{h}{BX} \rightarrow BX = h \cot \alpha$

$\therefore BW = BX$

$\therefore \triangle BWX$ is isosceles

- ii. Find the length of BM in terms of h and α .

1

In $\triangle TBW$, $\tan \alpha = \frac{h}{BW}$

$BW = h \cot \alpha$

In $\triangle BWM$, $BM = \sqrt{BW^2 - 20^2}$

$= \sqrt{h^2 \cot^2 \alpha - 400}$

or $= \sqrt{\frac{h^2}{\tan^2 \alpha} - 400}$

iii. Hence, or otherwise, show that the height of the flagpole is given by

3

$$h = \frac{40\sqrt{2}}{\sqrt{\cot^2 \beta - \cot^2 \alpha}}$$

In $\triangle TBY$, $\tan \beta = \frac{h}{BY}$

$$BY = h \cot \beta \quad \checkmark$$

In $\triangle BMY$, $\angle BMY = 90^\circ$ ($\triangle BWX$ isosceles)

$$\therefore BY^2 = BM^2 + MY^2 \quad (\text{Pythagoras' theorem})$$

$$h^2 \cot^2 \beta = h^2 \cot^2 \alpha - 400 + 60^2 \quad \checkmark$$

$$h^2 (\cot^2 \beta - \cot^2 \alpha) = 3200$$

$$h = \sqrt{\frac{3200}{\cot^2 \beta - \cot^2 \alpha}}$$

$$= \frac{40\sqrt{2}}{\sqrt{\cot^2 \beta - \cot^2 \alpha}}$$

i. $y = f(-x)$

2

ii. $y = \frac{1}{f(x)}$

2

iii. $y^2 = f(x)$

2

iv. $y = f(|x|)$

2

(b) For the function $f(x) = x^2 - 4x + 4$.

i. State the largest domain containing positive values for which $f(x)$ has an inverse. 1

$f(x) = (x-2)^2$
 $D: x \in \mathbb{R}, x \geq 2$ ✓

ii. Find the equation of the inverse function. 2

$x = (y-2)^2$
 $\pm \sqrt{x} = y-2$
 $y = \pm \sqrt{x} + 2$ ✓
 $= \sqrt{x} + 2$ ✓ (since $y \geq 2$) since the domain of $f(x)$ becomes range of $f^{-1}(x)$.

(c) i. Sketch the graph of $y = x$ and $y = 2^{-x}$ on the same axes. 1

ii. Hence, sketch the graph of $y = x + 2^{-x}$ by addition of ordinates, showing all important features. 1
