 $64x^7 - 112x^5 + 56x^3 - 7x + 1 = 0.$ Leave your answers
in the form $\sin \theta$, where $0 \leq \theta \leq 2\pi.$

- (b) A projectile with mass M is launched vertically into the air with
initial speed $v_0 m/s$. It experiences air resistance directly against its

projectile. The ACCELERATION due to gravity is $10m/s^2$. Initially
when the particle is launched the ground is at $x = 0.$
- (i) While the projectile is ascending, show that the time since it 2
was launched is given by $t = -5 \ln \left(\frac{50+v}{50+v_0} \right)$ and find the time taken
to reach the maximum height in terms of $v_0.$
- (ii) Show that $x = -5(50 + v_0)e^{-0.2t} - 50t + 5(50 + v_0)$ and 3
find an expression for the maximum height reached in terms of $v_0.$
- (iii) The particle now starts to fall. It still experiences resistance 2
AGAINST its direction of motion of $0.2Mv$ Newtons and acceleration
due to gravity of $10m/s^2$. Now letting where the projectile starts to
fall be $x = 0$, show that $x = 250e^{-0.2t} + 50t - 250.$
- (iv) If the particle lands back on the ground where it was launched from 2
10 seconds after it was launched, find the initial velocity (v_0) it was
launched at.

$$\begin{array}{ll} \text{LHS} & \text{RHS} \\ = 7^2 & = 5^2 + 2^2 \\ = 49 & = 29 \end{array}$$

LHS > RHS $\Rightarrow$ True for $n=2$.

Step 2: Assume true for $n=k, k \geq 2$.

i.e. $7^k > 5^k + 2^k$

Step 3: Prove true for $n=k+1$

i.e. RTP: $7^{k+1} > 5^{k+1} + 2^{k+1}, k \geq 2$.

$$\begin{aligned} & \text{LHS} \\ & 7^{k+1} \\ & = 7 \times 7^k \\ & > 7(5^k + 2^k) \text{ [By assumption]} \\ & = (5+2)(5^k + 2^k) \\ & = 5^{k+1} + 5 \times 2^k + 2 \times 5^k + 2^{k+1} \\ & > 5^{k+1} + 2^{k+1} \end{aligned}$$

LHS > RHS.

If it is true for $n=k$, it will be true for $n=k+1$. Hence it will be true $\forall k \in \mathbb{Z}^+ \geq 2$.

[Note: Could also be approached by proving $7^{k+1} - (5^{k+1} + 2^{k+1}) > 0$].

i.e. $\log_7 19 = \frac{p}{q}, p, q \in \mathbb{Z}$.

But 7 & 19 are both prime, so a number would have to exist s.t. its prime factors are 7^p & 19^q.

$\therefore$ This is not possible by the fundamental theorem of arithmetic.

Time to max height. $v = 0$

$$t = -5 \ln \left(\frac{50}{v_0+50} \right)$$

Time to max. height. $= 5 \ln \left(\frac{v_0+50}{50} \right)$

(ii) $t = -5 \ln \left[\frac{v+50}{v_0+50} \right]$

$$\therefore e^{-0.2t} = \frac{v+50}{v_0+50}$$

$$(v_0+50)e^{-0.2t} - 50 = v$$

$$x = \int_0^t (v_0+50)e^{-0.2t} - 50 \cdot dt$$

could also do $x = \int (v+50)e^{-0.2t} - 50 \cdot dt$ & use $x = 0$ when $t = 0$.

$$= \left[-5(v_0+50)e^{-0.2t} - 50t \right]_0^t$$

$$= [-5(v_0+50)e^{-0.2t} - 50t] + 5(v_0+50)e^{-0.2 \times 0} + 50 \times 0$$

$$x = -5(v_0+50)e^{-0.2t} - 50t + 5(v_0+50)$$

Q. (16)(b)(ii) (continued):

Max. height is when $v = 0$ [so $t = 5 \ln \left[\frac{v_0 + 50}{50} \right]$ from (i)].

$$\text{Note: } -0.2t = \ln \left[\frac{50}{v_0 + 50} \right]$$

$$\& e^{-0.2t} = \frac{50}{v_0 + 50}.$$

$$\begin{aligned} \text{So max. height} &= -5[v_0 + 50] \times \frac{50}{v_0 + 50} - 50 \times 5 \ln \left[\frac{v_0 + 50}{50} \right] + 5[v_0 + 50] \\ &= -250 - 250 \ln \left[\frac{v_0 + 50}{50} \right] + 5v_0 + 250 \end{aligned}$$

$$\text{Max. height reached} = \underline{5v_0 - 250 \ln \left(\frac{v_0 + 50}{50} \right)}$$

(16)(b)(iii)

Projectile falling from rest:

↓
10M

0.2MV

↑

$$F = Ma = 10M - 0.2MV$$

$$a = \frac{dv}{dt} = 10 - 0.2v$$

$$\frac{dt}{dv} = \frac{1}{10 - 0.2v}$$

$$= \frac{5}{50 - v}$$

$$t = -5 \int_0^v \frac{-1}{50 - v} dv$$

$$= -5 \left[\ln(50 - v) \right]_0^v$$

$$= -5 \ln \left[\frac{50 - v}{50} \right]$$

$$e^{-0.2t} = \frac{50 - v}{50}$$

$$v = 50 - 50e^{-0.2t}$$

$$x = \int_0^t 50 - 50e^{-0.2t} dt$$

$$= \left[50t + 250e^{-0.2t} \right]_0^t$$

$$= 50t + 250e^{-0.2t} - 250$$

(16)(b)(iv) From (i) & (ii):

As projectile reached a height of $5v_0 - 250 \ln \left[\frac{v_0 + 50}{50} \right]$

after $5 \ln \left[\frac{v_0 + 50}{50} \right]$ seconds,

it will also fall $5v_0 - 250 \ln \left[\frac{v_0 + 50}{50} \right]$ (1)

in $10 - 5 \ln \left[\frac{v_0 + 50}{50} \right]$ seconds.

Using x when projectile is falling

$$x = 50t + 250e^{-0.2t} - 250$$

Note: If $t = 10 - 5 \ln \left[\frac{v_0 + 50}{50} \right]$

$$t = \ln[e^{10}] - 5 \ln \left[\frac{v_0 + 50}{50} \right]$$

$$= -5 \ln[e^{-2}] - 5 \ln \left[\frac{v_0 + 50}{50} \right]$$

$$= -5 \ln \left[\frac{v_0 + 50}{50e^2} \right]$$

$$e^{-0.2t} = \frac{v_0 + 50}{50e^2}$$

$$\& x = 50t + 250e^{-0.2t} - 250$$

$$= 50 \times \left[10 - 5 \ln \left[\frac{v_0 + 50}{50} \right] \right] + 250 \times \frac{(v_0 + 50)}{50e^2} - 250$$

$$= 500 - 250 \ln \left[\frac{v_0 + 50}{50} \right] + \frac{5(v_0 + 50)}{e^2} - 250$$

$$x = 250 + \frac{5(v_0 + 50)}{e^2} - 250 \ln \left[\frac{v_0 + 50}{50} \right] \quad (2)$$

As this is how far projectile has fallen, (1) = (2)

$$5v_0 - 250 \ln \left[\frac{v_0 + 50}{50} \right] = 250 + \frac{5(v_0 + 50)}{e^2} - 250 \ln \left[\frac{v_0 + 50}{50} \right]$$

$$5v_0 = 250 + \frac{5(v_0 + 50)}{e^2}$$

$$5e^2 v_0 = 250e^2 + 5v_0 + 250$$

$$(5e^2 - 5)v_0 = 250e^2 + 250$$

$$v_0 = 65.65 \dots \text{ m/s.}$$
