

Student Name: _____

Maths class: _____

James Ruse Agricultural High School

2023

YEAR 12 Task 1 HSC Examination

Mathematics Extension 2

General Instructions

- Reading time – 5 minutes
- Working time – 75 minutes
- Write using black pen
- Calculators approved by NESA may be used
- A reference sheet is provided
- In Questions 6–10, show relevant mathematical reasoning and/ or calculations

Total marks: 45

Section I – 5 marks

- Attempt Questions 1–5
- Allow about 7 minutes for this section

Section II – 40 marks

- Attempt Questions 6–10
- Allow about 68 minutes for this section

Start your answer to each question on a separate piece of paper.

Section I

5 marks

Attempt Questions 1-5

Allow about 7 for this section

Write your answers on the multiple choice answer sheet provided.

1. Evaluate $i^{2022} + i^{2023} + i^{2024}$

- (A) i
- (B) $-i$
- (C) 1
- (D) -1

2. A complex number z is defined such that $\operatorname{Re}(z) > 0$ and $\operatorname{Im}(z) < 0$. Which of the following is a suitable range for $\arg(z^3)$?

- (A) $\left(\frac{\pi}{2}, 2\pi\right)$
- (B) $\left(0, \frac{\pi}{2}\right)$
- (C) $(0, 2\pi)$
- (D) $\left(-\frac{\pi}{2}, 0\right)$

3. If the complex numbers ω and z represent two diagonally opposite vertices of a square, then the other two vertices could be given by the complex numbers:

- (A) $\frac{1}{2}(z - w) + \frac{1}{2}i(z - w)$ and $\frac{1}{2}(z - w) - \frac{1}{2}i(w - z)$
- (B) $\frac{1}{2}(\omega + z) + \frac{1}{2}i(\omega + z)$ and $\frac{1}{2}(\omega + z) - \frac{1}{2}i(\omega + z)$
- (C) $\frac{1}{2}(\omega - z) + \frac{1}{2}i(\omega - z)$ and $\frac{1}{2}(\omega - z) - \frac{1}{2}i(\omega - z)$
- (D) $\frac{1}{2}(\omega + z) + \frac{1}{2}i(\omega - z)$ and $\frac{1}{2}(\omega + z) - \frac{1}{2}i(\omega - z)$

4. Let $a, b, c \in \mathbb{R}$. If the equation $x^4 + ax^3 + bx^2 + cx + 1 = 0$ has no real roots and if at least one root is of modulus one, then which of the following is true?

- (A) $b = c$
- (B) $a = b$
- (C) $a = c$
- (D) None of the above

5. Which of the following options represents the shaded region, R , below?

- (A) $\frac{\pi}{2} \leq \text{Arg} \left(\frac{z-1}{z+1} \right) \leq \frac{3\pi}{4}$
- (B) $\frac{\pi}{4} \leq \text{Arg} \left(\frac{z-1}{z+1} \right) \leq \frac{\pi}{2}$
- (C) $\text{Arg} \left(\frac{z-1}{z+1} \right) \leq \frac{\pi}{2}$ and $\text{Arg} \left(\frac{z-1}{z+1} \right) \geq \frac{3\pi}{4}$
- (D) $\text{Arg} \left(\frac{z-1}{z+1} \right) \leq \frac{\pi}{4}$ and $\text{Arg} \left(\frac{z-1}{z+1} \right) \geq \frac{\pi}{2}$

Section II begins on the next page

Section II

40 marks

Attempt Questions 6-10

Allow about 68 minutes for this section

Start each question on a new page. Extra paper is available.

In Questions 6-10, your responses should include relevant mathematical reasoning and/ or calculations.

Question 6 (8 marks) Start a new page.

- (a) If $z = 3 + 4i$ and $\omega = 2 - i$, simplify the following, giving your answer in the form $x + iy$

(i) $z - 2\omega$

1

(ii) $z\bar{z} - \omega\bar{\omega}$

1

(iii) $\frac{z}{\omega}$

2

- (b) Given two complex numbers $z = \sqrt{3} + i$ and $\omega = 6\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$. Express $\frac{z\omega}{4i}$ in the form $r(\cos\theta + i\sin\theta)$.

2

- (c) The point P on the Argand diagram represents the complex number z . The points Q and R represent the points ωz and $\bar{\omega}z$ respectively, where $\omega = \cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}$. The point M is the midpoint of QR .

- (i) Find the complex number representing M in terms of z .

1

- (ii) The point S is chosen so that $PQSR$ is a parallelogram. Find the complex number represented by S .

1

Question 7 (8 marks) Start a new page.

- (a) The complex number z is such that $|z| = 1$ and $\arg(z) = \frac{\pi}{4}$.
- (i) Find the coordinates of points A representing z^2 , and B representing $z^2 - \bar{z}$ respectively and plot the points on a common half-page Argand diagram. 2
- (ii) Prove that $|z^2 - \bar{z}| = |z + 1|$. 2
- (b) (i) Find the square roots of $-63 + 16i$ 2
- (ii) Hence or otherwise, solve for z in the equation $2z^2 + (\sqrt{63})iz - 2i = 0$. Write your answers in the form $x + iy$. 2

Question 8 (8 marks) Start a new page.

- (a) (i) Show that $\cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2}$ 1
- (ii) Hence or otherwise, prove that the solution to θ in the equation $\cos \theta = 2$ is that of $e^{i\theta} = 2 \pm \sqrt{3}$ 1
- (b) The complex number z satisfies the relationship $5(z + i)^n = (4 + 3i)(1 + iz)^n, n \in \mathbb{R}$. Show that z is a real number. 3
- (c) Find all complex numbers z satisfying both $\text{Arg}(z^2 - 4) = \frac{5\pi}{6}$ and $\text{Arg}(z^2 + 4) = \frac{\pi}{3}$ 3

Question 9 (8 marks) Start a new page.

- (a) (i) Let $a \in \mathbb{C}$ and $b \in \mathbb{R}, b \geq 0$. Show that the equation 2
- $$z\bar{z} = a\bar{z} + \bar{a}z + b$$
- for $z \in \mathbb{C}$ can be written in the form $|z - a| = r$, where $r \geq 0$.
- Let A and B be two points on the complex plan representing $2 + 3i$ and $1 + 2i$ respectively. The point P , representing the complex number z , moves such that $PA = \sqrt{2}PB$.
- (ii) Show that the equation of the path traced out by P is a circle with equation 3
- $$\mathcal{C}_1: z\bar{z} = i\bar{z} - iz + 3.$$
- State its centre and radius.
- Let Q , representing ω , be a point on the circle $\mathcal{C}_1$.
- (iii) Show that the circle $\mathcal{C}_2$ given by $\left|z - \left(\omega + \frac{\omega - i}{|\omega - i|}\right)\right| = 1$ touches $\mathcal{C}_1$ at Q externally. 3

Question 10 (8 marks) Start a new page.

- (a) A student is in the initial stages of programming a simple robotic car. So far, the car only moves in a straight line 1 unit at a time. After each 1 unit move forward, it changes direction by turning to the right through an acute angle of α radians and then moving forward another 1 unit. An example of a possible path is shown below with 4 forward moves.

During a test run, the car starts from the origin and initially moves to the right. It moves forward a total of 24 times before finally stopping.

- (i) Explain why the final position of the car can be represented by the expression **1**
- $$1 + e^{-i\alpha} + e^{-i2\alpha} + \dots + e^{-i23\alpha}.$$
- (ii) If the car's final position is the same as its initial position, find all possible values of α . **2**
- (iii) If the **only** time the car reaches its initial position during its path is when it arrives at its final position, find all possible values of α , giving reasons. **2**

The test run is considered to be *successful* if the car stops within a one unit distance from its starting point.

- (iv) Show that for the test to be considered *successful*, then α must satisfy $|\sin(12\alpha)| \leq$ **3**
- $$\left| \sin\left(\frac{\alpha}{2}\right) \right|.$$

END OF EXAMINATION

2023 Year 12 Task 1 Extension 2

1. Evaluate $i^{2022} + i^{2023} + i^{2024}$

A) i
 B) $-i$
 C) 1
 D) -1

2. If the complex numbers ω and z represent two diagonally opposite vertices of a square, then the other two vertices could be given by the complex numbers:

(A) $\frac{1}{2}(z - w) + \frac{1}{2}i(z - w)$ and $\frac{1}{2}(z - w) - \frac{1}{2}i(w - z)$
 (B) $\frac{1}{2}(\omega + z) + \frac{1}{2}i(\omega + z)$ and $\frac{1}{2}(\omega + z) - \frac{1}{2}i(\omega + z)$
 (C) $\frac{1}{2}(\omega - z) + \frac{1}{2}i(\omega - z)$ and $\frac{1}{2}(\omega - z) - \frac{1}{2}i(\omega - z)$
 (D) $\frac{1}{2}(\omega + z) + \frac{1}{2}i(\omega - z)$ and $\frac{1}{2}(\omega + z) - \frac{1}{2}i(\omega - z)$

3. A complex number z_1 is defined such that $\operatorname{Re}(z_1) > 0$ and $\operatorname{Im}(z_1) < 0$. Which of the following is a suitable range for $\arg(z_1^3)$?

A) $\left(\frac{\pi}{2}, 2\pi\right)$
 B) $\left(0, \frac{\pi}{2}\right)$
 C) $(0, 2\pi)$
 D) $\left(-\frac{\pi}{2}, 0\right)$

4. Let $a, b, c \in \mathbb{R}$. If the equation $x^4 + ax^3 + bx^2 + cx + 1 = 0$ has no real roots and if at least one root is of modulus one, then which of the following is true?

(A) $b = c$
 (B) $a = b$
 (C) $a = c$
 (D) None of the above.

5. Which of the following options represents the shaded region below?

(A) $\frac{\pi}{2} \leq \operatorname{Arg}\left(\frac{z-1}{z+1}\right) \leq \frac{3\pi}{4}$
 (B) $\frac{\pi}{4} \leq \operatorname{Arg}\left(\frac{z-1}{z+1}\right) \leq \frac{\pi}{2}$
 (C) $\operatorname{Arg}\left(\frac{z-1}{z+1}\right) \leq \frac{\pi}{2}$ and $\operatorname{Arg}\left(\frac{z-1}{z+1}\right) \geq \frac{3\pi}{4}$
 (D) $\operatorname{Arg}\left(\frac{z-1}{z+1}\right) \leq \frac{\pi}{4}$ and $\operatorname{Arg}\left(\frac{z-1}{z+1}\right) \geq \frac{\pi}{2}$

Question 6

(a) $Z = 3 + 4i$, $w = 2 - i$

$$\begin{aligned} \text{(i)} \quad Z - 2w &= 3 + 4i - 2(2 - i) \\ &= 3 + 4i - 4 + 2i \\ &= -1 + 6i \quad \checkmark \end{aligned}$$

$$\begin{aligned} \text{(ii)} \quad Z\bar{Z} - w\bar{w} &= |Z|^2 - |w|^2 \\ &= 3^2 + 4^2 - (2^2 + (-1)^2) \\ &= 9 + 16 - 4 - 1 \\ &= 20 \quad \checkmark \end{aligned}$$

$$\text{(iii)} \quad \frac{Z}{w} = \frac{Z\bar{w}}{|w|^2} = \frac{(3+4i)(2+i)}{2^2+(-1)^2} = \frac{6+3i+8i-4}{5} = \frac{2+11i}{5} \quad \checkmark$$

(b) $Z = \sqrt{3} + i$ and $w = 6\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)$
 $= 2\left(\frac{\sqrt{3}}{2} + \frac{1}{2}i\right) = 2\left(\cos \frac{\pi}{6} + i \sin \frac{\pi}{6}\right)$ $\checkmark$

$$\frac{Zw}{4i}$$

$$= \frac{2\left(\cos \frac{\pi}{6} + i \sin \frac{\pi}{6}\right) \times 6\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)}{4\left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}\right)}$$

$$= 3\left(\cos\left(\frac{\pi}{6} + \frac{2\pi}{3} - \frac{\pi}{2}\right) + i \sin\left(\frac{\pi}{6} + \frac{2\pi}{3} - \frac{\pi}{2}\right)\right)$$

$$= 3\left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}\right) \quad \checkmark$$

(c)

(i) The complex number representing M

$$\begin{aligned} \text{is } \frac{\omega Z + \bar{\omega} Z}{2} &= \frac{(\omega + \bar{\omega}) Z}{2} \\ &= \frac{2 \cos 2\pi/3}{2} Z \\ &= \cos \frac{2\pi}{3} Z \\ &= -\frac{Z}{2} \quad \checkmark \end{aligned}$$

(ii) $SA = RP$ Let α the complex number representing S

$$\omega Z - \alpha = Z - \bar{\omega} Z$$

$$\begin{aligned} \alpha &= (\omega + \bar{\omega}) Z - Z \\ &= -Z - Z \\ &= -2Z \quad \checkmark \end{aligned}$$

Marker's Comments

c, ALGEBRAIC APPROACH:

$$\text{Let } z^2 = x+iy$$

$$\therefore \text{Arg}(x+iy-4) = \frac{5\pi}{6}$$

$$\Rightarrow \tan^{-1}\left(\frac{y}{x-4}\right) = \frac{5\pi}{6}$$

$$\Rightarrow \frac{y}{x-4} = -\frac{1}{\sqrt{3}}$$

$$\Rightarrow y\sqrt{3} = 4-x$$

①

$$\therefore \text{Arg}(x+iy+4) = \frac{\pi}{3}$$

$$\Rightarrow \tan^{-1}\left(\frac{y}{x+4}\right) = \frac{\pi}{3}$$

$$\Rightarrow \frac{y}{x+4} = \frac{1}{\sqrt{3}}$$

$$\Rightarrow y = \sqrt{3}x + 4\sqrt{3}$$

②

Sub ② into ①:

$$\sqrt{3}(\sqrt{3}x + 4\sqrt{3}) = 4-x$$

$$3x + 12 = 4-x$$

$$4x = -8$$

$$x = -2$$

$$\therefore y = 2\sqrt{3}$$

$$\therefore z^2 = -2 + 2\sqrt{3}i$$

$$= 1 + 2 \times 1 \times \sqrt{3}i + (\sqrt{3}i)^2$$

$$z^2 = (1 + \sqrt{3}i)^2$$

$$\therefore z = \pm(1 + \sqrt{3}i)$$

Marker's Comments

GEOMETRIC METHOD:

$$\operatorname{Arg}(z^2 - 4) = \frac{5\pi}{6} \quad \& \quad \operatorname{Arg}(z^2 + 4) = \frac{\pi}{3}$$

$$\angle OCB = \frac{\pi}{3} \quad (\text{alternate angles})$$

$$\angle OAC = \frac{\pi}{6} \quad (\text{alternate angles})$$

$$\text{Now } \frac{OC}{AC} = \sin \frac{\pi}{6}$$

$$\frac{OC}{AC} = \frac{1}{2}$$

$$\therefore OC = \frac{1}{2} AC$$

$$= 4$$

$$\text{But } BC = 4 = OC$$

$\therefore \triangle OBC$ is isosceles with included angle of $\frac{\pi}{3}$

$\therefore \triangle OBC$ is equilateral

$$\therefore OB = 4$$

$$\Rightarrow z^2 = 4 e^{\frac{2\pi i}{3}}$$

$$\Rightarrow z = \pm 2 e^{\frac{\pi i}{3}}$$

$$= \pm (1 + \sqrt{3}i)$$

Question 9

a)

i. $z\bar{z} = a\bar{z} + \bar{a}z + b$

Let $z = x + iy$ and $a = c + id$

$$\begin{aligned}x^2 + y^2 &= (c + id)(x - iy) + (c - id)(x + iy) + b \\&= (cx - cyi + dxi + dy) + (cx + cyi - dxi + dy) + b \\&= 2(cx + dy) + b\end{aligned}$$

1 mark

$$x^2 - 2cx + y^2 - 2dy = b$$

$$(x^2 - 2cx + c^2) + (y^2 - 2dy + d^2) = b + c^2 + d^2$$

$$(x - c)^2 + (y - d)^2 = b + c^2 + d^2$$

$$|(x - c) + (y - d)i|^2 = b + c^2 + d^2$$

$$|z - a|^2 = b + c^2 + d^2$$

$$\begin{aligned}|z - a| &= \sqrt{b + |a|^2} \\&= r \quad (\text{Since } b, c, d \in \mathbb{R})\end{aligned}$$

$$|z - a| = r \text{ where } r = \sqrt{b + |a|^2}$$

1 mark

ii. Let $P(x, y)$ represent the complex number $x + iy$

$$PA = \sqrt{2}PB \Rightarrow |PA|^2 = 2|PB|^2$$

$$(x - 2)^2 + (y - 3)^2 = 2(x - 1)^2 + 2(y - 2)^2 \quad \text{1 mark for interpreting condition algebraically}$$

(Note: It was given $PA = \sqrt{2}PB$, NOT $\overrightarrow{PA} = \sqrt{2}\overrightarrow{PB}$, if you equate the two without a square root or having squared both sides you don't receive the first mark)

$$(x^2 - 4x + 4) + (y^2 - 6y + 9) = (2x^2 - 4x + 2) + (2y^2 - 8y + 8)$$

$$x^2 + y^2 - 2y = 3$$

$$x^2 + (y^2 - 2y + 1) = 4$$

$$x^2 + (y - 1)^2 = 4$$

$\therefore$ The vector equation of this circle is given by $|z - i| = 2$

which can be expressed as $z\bar{z} = i\bar{z} - iz + b$

1 mark

Since $r = \sqrt{b + |a|^2}$ (proven in part i)

$$2 = \sqrt{b + 1^2}$$

$$b + 1 = 4$$

$$b = 3$$

$\therefore P$ traces out a path given by $z\bar{z} = i\bar{z} - iz + 3$ which is a circle with radius 2 and centre (0,1).

1 mark

- iii. The circles are externally tangential if the distance between the centres are equal to the sum of the two radii. That is,

1 mark for interpreting what is required geometrically

$$C_2 \text{ is given by: } \left| z - \left(\omega + \frac{\omega - i}{|\omega - i|} \right) \right| = 1$$

$$\omega \text{ lies on } C_1 \Rightarrow |\omega - i| = 2$$

$$\therefore \left| z - \left(\omega + \frac{\omega - i}{2} \right) \right| = 1 \quad \text{1 mark for simplifying equation of } C_2 \text{ using the fact that } \omega \text{ lies on } C_1$$

$$\left| z - \left(\frac{3\omega - i}{2} \right) \right| = 1$$

$\therefore$ Distance between the two centres is given by:

$$\left| i - \left(\frac{3\omega - i}{2} \right) \right| = \left| \frac{2i - 3\omega + i}{2} \right|$$

$$= \left| \frac{3i - 3\omega}{2} \right|$$

$$= \frac{3}{2} |i - \omega|$$

$$= \frac{3}{2} \times 2$$

$$= 3$$

1 mark for completing the proof

Question 10

- i. The path of the car is shown below.

Each forward movement has a distance of 1 unit and turns to the right by α each time. This is equivalent to multiply by $e^{-i\alpha}$ each time, where $0 < \alpha < \frac{\pi}{2}$.

Therefore, the final position is given by :

$$1 + 1 \times e^{-i\alpha} + 1 \times (e^{-i\alpha})^2 + 1 \times (e^{-i\alpha})^3 + \dots 1 \times (e^{-i\alpha})^{23} \\ = 1 + e^{-i\alpha} + e^{-i2\alpha} + e^{-i3\alpha} + \dots + e^{-i23\alpha}$$

(1 mark for providing correct explanation: stating each movement has a distance of 1 unit, and turns to the right by α is to multiply by $e^{-i\alpha}$)

- ii. The car's final position is the same as its initial position, which means:

$$1 + e^{-i\alpha} + e^{-i2\alpha} + e^{-i3\alpha} + \dots + e^{-i23\alpha} = 0$$

That is:

$$\frac{1 - e^{-24i\alpha}}{1 - e^{-i\alpha}} = 0 \quad (1 \text{ mark})$$

$$e^{-24i\alpha} = 1,$$

(The denominator can not be zero since $0 < \alpha < \frac{\pi}{2}$)

Therefore:

$$24\alpha = 2k\pi$$

$$\alpha = \frac{2k\pi}{24}$$

Where:

$$0 < \frac{2k\pi}{24} < \frac{\pi}{2}, \quad k \in \mathbb{Z}$$

$$0 < k < 6$$

$$\therefore k = 1, 2, 3, 4, 5$$

Therefore, possible values of α are

$$\frac{\pi}{12}, \frac{\pi}{6}, \frac{\pi}{4}, \frac{\pi}{3}, \frac{10\pi}{24} \quad (1 \text{ mark})$$

- iii. In order for the car to reach the original position for the first time, we need values of k which has no factors in common with 24 except 1.

That is $k = 1, 5$

$$\therefore k = 1, \quad \alpha = \frac{\pi}{12}$$

$$k = 5, \quad \alpha = \frac{10\pi}{24}$$

(1 mark for providing correct reason, 1 mark for correct answer)

(Common mistakes: many students assume that the path of the car must be regular polygons. The paths for three cases are shown below for your reference.)

For case 1, $k = 1$, $\alpha = \frac{\pi}{12}$

For case 2, $k = 5$, $\alpha = \frac{5\pi}{12}$

For case 3, $k = 2$, $\alpha = \frac{\pi}{6}$

iv. For the test to be successful, the following condition must be met:

$$|1 + e^{-i\alpha} + e^{-i2\alpha} + e^{-i3\alpha} + \dots + e^{-i23\alpha}| \leq 1$$

$$\begin{aligned} 1 + e^{-i\alpha} + e^{-i2\alpha} + e^{-i3\alpha} + \dots + e^{-i23\alpha} &= \frac{1 - e^{-24i\alpha}}{1 - e^{-i\alpha}} \\ &= \frac{e^{-12i\alpha}(e^{12i\alpha} - e^{-12i\alpha})}{e^{-i\frac{\alpha}{2}}(e^{i\frac{\alpha}{2}} - e^{-i\frac{\alpha}{2}})} \\ &= e^{-\frac{23}{2}i\alpha} \times \frac{2i \sin(12\alpha)}{2i \sin(\frac{\alpha}{2})} \end{aligned}$$

1 mark

$$\therefore \left| e^{-\frac{23}{2}i\alpha} \times \frac{2i \sin(12\alpha)}{2i \sin(\frac{\alpha}{2})} \right| \leq 1$$

1 mark

$$\left| e^{-\frac{23}{2}i\alpha} \right| \times \left| \frac{2i \sin(12\alpha)}{2i \sin(\frac{\alpha}{2})} \right| \leq 1$$

Since $\left|e^{-\frac{23}{2}i\alpha}\right| = 1$

$$\therefore \left| \frac{2i \sin(12\alpha)}{2i \sin(\frac{\alpha}{2})} \right| \leq 1$$

1 mark

$$|2i \sin(12\alpha)| \leq \left| 2i \sin(\frac{\alpha}{2}) \right|$$

That is:

$$|\sin(12\alpha)| \leq \left| \sin(\frac{\alpha}{2}) \right|$$
