

# 2020 TRIAL EXAMINATION CHEMISTRY Form VI

## STRUCTURE OF PAPER

### SECTION I

A: Multiple Choice 20 marks

Allow about 30 minutes for this section.

SECTION II 80 marks

Allow about 2 hours and 30 minutes for this section.

## EXAMINATION

DATE: Thursday 20<sup>th</sup> August 8:40am

DURATION: 3 hours + 5 minutes reading time

MARKS: 100

## CHECKLIST

Each boy should have the following:

- ☐ 1 Examination Paper (data sheet attached on back)
- ☐ 1 Multiple-Choice Answer Sheet

## EXAM INSTRUCTIONS

- **Remove the centre staple** and hand in all parts of the paper in a neat bundle.
- WRITE YOUR **CANDIDATE NUMBER** IN THE SPACE PROVIDED AT THE TOP OF EACH PAGE WHERE INDICATED.

**LEFT BLANK INTENTIONALLY**

## SECTION I: MULTIPLE CHOICE (20 marks)

Attempt ALL Questions  
Use the Multiple-Choice Answer Sheet.

---

- 1 Which of the following matches the inorganic acid and base with their correct formula?

|     | Acid                           |            | Base                          |                  |
|-----|--------------------------------|------------|-------------------------------|------------------|
| (A) | H <sub>2</sub> PO <sub>4</sub> | phosphoric | NaOH                          | sodium hydroxide |
| (B) | HNO <sub>3</sub>               | nitrous    | NH <sub>3</sub>               | ammonia          |
| (C) | NH <sub>4</sub> <sup>+</sup>   | ammonium   | CO <sub>3</sub> <sup>2-</sup> | carbonate        |
| (D) | H <sub>2</sub> SO <sub>3</sub> | sulfurous  | CaO                           | calcium dioxide  |

- 2 Which of the following is considered to be a limitation of Arrhenius' model of acids and bases?
- (A) He did not account for acids that do not contain oxygen.
- (B) He did not account for the presence of hydrogen-containing compounds which are non-acidic in nature.
- (C) He did not recognise the importance of water as a solvent in the nature of acids and bases.
- (D) He did not recognise that some substances can act as acids or bases in the absence of solvents.
- 3 Which of the following statements with regards to acid and base strength and concentration is true?
- (A) To neutralise a given amount of strong base, the number of moles of a monoprotic weak acid is the same as that required for a monoprotic strong acid.
- (B) The same concentration of strong and weak monoprotic acids will contain the same chemical amount of hydrogen ions.
- (C) A weak acid is unable to neutralise a strong base.
- (D) The pOH of a strong concentrated base will be greater than that of a weak dilute acid.

- 4 If the pH of a solution was shown to be 10.5, what could we conclude about the following parameters?
- (A) The pOH will be  $10^{-3.5}$
  - (B) The  $H^+$  concentration will be 1.02
  - (C) The  $OH^-$  concentration will be  $3.16 \times 10^{-4}$
  - (D) The  $H^+$  concentration x the  $OH^-$  concentration will be  $10^{14}$
- 5 Which of the following statements correctly describes the relationship between the strength of an acid, its hydrogen ion concentration, its pH and its  $pK_a$ ?
- (A) The stronger the acid, the lower the  $pK_a$  value.
  - (B) A strong acid will have a  $pK_a$  somewhere between 0.001 and 1000.
  - (C) An acid with a low pH will have a very large  $pK_a$ .
  - (D) The greater the  $K_a$ , the larger the  $pK_a$  value.
- 6 If a monoprotic acid has pH value of 3.2 and a concentration of 0.15 mol/L, what will its  $K_a$  value be closest to?
- (A)  $2.7 \times 10^{-6}$
  - (B)  $6.3 \times 10^{-4}$
  - (C) 5.6
  - (D)  $3.8 \times 10^5$

- 7 Solid potassium amide  $KNH_2$  reacts with water according to the equation:

The acid and its respective conjugate base in this reaction are:

- (A)  $K^+$  and KOH
- (B)  $H_2O$  and  $OH^-$
- (C)  $NH_2^-$  and  $NH_3$
- (D)  $NH_3$  and  $NH_2^-$

- 8 A reaction in dynamic equilibrium is one in which:
- (A) the concentration of the product is always independent of reaction conditions
  - (B) the enthalpy changes for the forward and the reverse reactions are equal
  - (C) the activation energies for the forward and the reverse reactions are equal
  - (D) the rates of the forward and the reverse reactions are equal
- 9 Iodine was added to 50 mL of each of two immiscible solvents X and Y in a separating funnel as shown below.

After shaking, the following equilibrium was established:

An extra 10 mL of solvent X was added, the mixture shaken and equilibrium was allowed to re-establish. Which of the following statements is correct?

- (A) The concentration of I<sub>2</sub> in Y increases
  - (B) The concentration of I<sub>2</sub> in Y decreases
  - (C) The equilibrium constant increases
  - (D) The equilibrium constant decreases
- 10 Photosynthesis is not considered to be an equilibrium reaction because:
- (A) it has a large negative  $\Delta H$  value
  - (B) it has a small negative  $\Delta S$  value
  - (C) it has a large positive  $\Delta G$  value
  - (D) it has a zero  $\Delta G$  value

- 11 Will lead(II) chloride precipitate when 50 mL of 0.10 M  $\text{Pb}(\text{NO}_3)_2$  solution is mixed with 50 mL of 0.10 M NaCl solution?
- (A) Yes, because the ion product is greater than the  $K_{\text{sp}}$ .  
(B) Yes, because the  $K_{\text{sp}}$  is greater than the ion product.  
(C) No, because the ion product is smaller than the  $K_{\text{sp}}$ .  
(D) No, because the  $K_{\text{sp}}$  is smaller than the ion product.

- 12 The reaction:

has an equilibrium constant of 3.9 at 950 °C.

The equilibrium concentrations of CO (g),  $\text{H}_2$  (g) and  $\text{H}_2\text{O}$  (g) are given in the table.

| Substance                | Equilibrium concentration (mol L <sup>-1</sup> ) |
|--------------------------|--------------------------------------------------|
| CO (g)                   | $5.0 \times 10^{-2}$                             |
| $\text{H}_2$ (g)         | $1.0 \times 10^{-2}$                             |
| $\text{H}_2\text{O}$ (g) | $4.0 \times 10^{-3}$                             |

What is the equilibrium concentration of  $\text{CH}_4$  (g), in mol L<sup>-1</sup>, at 950 °C?

- (A)  $2.0 \times 10^{-7}$   
(B)  $4.9 \times 10^{-5}$   
(C)  $3.1 \times 10^{-5}$   
(D)  $4.9 \times 10^{-1}$
- 13 A solution is made by dissolving solid sodium hydroxide and barium hydroxide in water. Which of the following must be true regarding the concentrations of each of the ions in solution formed?
- (A)  $[\text{Na}^+] = [\text{Ba}^{2+}] = [\text{OH}^-]$   
(B)  $[\text{Na}^+] = [\text{Ba}^{2+}] = 3 [\text{OH}^-]$   
(C)  $[\text{Na}^+] + 2 [\text{Ba}^{2+}] = 3 [\text{OH}^-]$   
(D)  $[\text{Na}^+] + 2 [\text{Ba}^{2+}] = [\text{OH}^-]$

- 14 Complete combustion of an organic compound forms 40 mL of carbon dioxide and 40 mL of water vapour, under the same conditions of temperature and pressure. Which of the following could be the molecular formula of the organic compound?

- (A)  $C_3H_8$   
(B)  $C_2H_2O$   
(C)  $C_2H_3N$   
(D)  $C_2H_4O$

- 15 Four atoms, 1–4, are labelled in the structure below.

Which atom has a trigonal **planar** arrangement of bonds around it?

- (A) Atom 1  
(B) Atom 2  
(C) Atom 3  
(D) Atom 4
- 16 Which compound(s) is/are structural isomer(s) of  $C_6H_{12}O_2$ ?

- I hexanoic acid  
II ethyl butanoate  
III propyl propanoate

- (A) Only I  
(B) I and II only  
(C) II and III only  
(D) All of I, II and III

17 What is the IUPAC name of the following compound?

- (A) 1,1,2-trimethylpentane
  - (B) 2,3-dimethylhexane
  - (C) 4,5-dimethylhexane
  - (D) 4,5,5-trimethylpentane
- 18 In the infra-red spectrum of an organic compound, a strong band is observed at  $3000\text{ cm}^{-1}$ . The most likely explanation for this band is:
- (A) the electrons absorb this IR radiation and are excited to a higher orbital.
  - (B) protons absorb the radiation at this frequency and change their spin.
  - (C) absorption of this IR radiation wavenumber causes vibrations of the C-H bonds.
  - (D) absorption of this wavenumber of IR radiation causes a substitution reaction.
- 19 Bromine water can be used to test for the presence of which of the following organic functional groups?
- (A) Carbon-carbon double bonds
  - (B) Hydroxyl groups
  - (C) Carboxylic acids
  - (D) Aldehydes and ketones

- 20** The proton NMR spectrum for butan-2-one is shown below, along with a numbered structure of butan-2-one.

Identify the position (1-4) of hydrogen atoms that are responsible for the singlet peak at 2.1 ppm.

- (A) 1
- (B) 2
- (C) 3
- (D) 4

**LEFT BLANK INTENTIONALLY**

## SECTION II: 80 marks

Attempt ALL Questions  
Write your answer in the space provided.

CANDIDATE NUMBER

### Question 21 (4 marks)

**Marks**

Acids react with carbonates in predictable ways. Formic acid has the formula  $\text{HCOOH}$  and its  $\text{pK}_a$  is 3.75.

- (a) Write a balanced chemical equation to represent the reaction between formic acid and sodium carbonate.

.....  
.....

**1**

- (b) State whether you would expect the salt formed in part (a) to be acidic, neutral or basic. Explain your answer including an appropriate equation.

.....  
.....  
.....  
.....  
.....  
.....

**3**

**Question 22** (3 marks)**Marks**

The dihydrogen phosphate ion has the formula  $\text{H}_2\text{PO}_4^-$ .

(a) Write an equation to show dihydrogen phosphate reacting with:

(i) an acid

.....

**1**

(ii) a base

.....

**1**

(b) Identify the term that we use to describe substances that can act as both acids and bases, such as dihydrogen phosphate.

.....

**1**

**Question 23** (4 marks)**Marks**

The equipment shown below may be used to measure the enthalpy of neutralisation.

10.0 mL of 0.500 M solution of HCl are mixed with 10.0 mL of 0.500 M solution of NaOH in the cup shown. The enthalpy change for this reaction is  $-55.8 \text{ kJ mol}^{-1}$ .

- (a) If the initial temperature of the reactants was  $25.0^\circ\text{C}$ , calculate the final temperature once the reaction had finished.

.....

.....

.....

.....

.....

.....

**3**

- (b) State one assumption you made in this calculation.

.....

.....

**1**

**Question 24** (5 marks)**Marks**

50.0 mL of a solution of HCl with pH 3.0 was mixed with 30.0 mL of a solution of HNO<sub>3</sub> with pH 5.0.

- (a) Calculate the pH of the resultant solution.

**3**

.....

.....

.....

.....

.....

.....

- (b) Explain how the pH and H<sup>+</sup> concentration of the resultant solution would differ from that calculated above, if ethanoic acid was used instead of nitric acid.

**2**

.....

.....

.....

.....

**Question 25** (9 marks)**Marks**

An acid / base titration was undertaken using an electronic pH meter. The resultant data is shown in the table below.

| Volume of acid added (mL) | pH  |
|---------------------------|-----|
| 40                        | 9.4 |
| 88                        | 8.6 |
| 94                        | 8.0 |
| 98                        | 7.6 |
| 101                       | 2.2 |
| 104                       | 1.4 |
| 116                       | 1.2 |
| 140                       | 0.8 |

- (a) Plot the data provided on the grid below and draw a line of best fit.

Question continued on next page.

**Question continued.****Marks**

- (b) By analysing your graph, deduce the strength of the base used in this titration.

3

.....

.....

.....

.....

.....

.....

- (c) Titrations can also be done by means of a chemical indicator in place of a pH meter. These indicators are usually weak acids in equilibrium with their conjugate bases, at roughly equal concentrations when they change colour. Explain why it is important during titrations to keep the amount of indicator added to a minimum.

.....

.....

.....

.....

.....

.....

.....

.....

CANDIDATE NUMBER

**Question 26** (9 marks)

**Marks**

Silver carbonate and silver chloride are only slightly soluble in water.

In the following, assume that the temperature is a constant 25°C.

- (a) Write an ionic equation for the dissociation of solid silver carbonate,  $\text{Ag}_2\text{CO}_3$ , in water.

.....

.....

**1**

- (b) Write the solubility product expression,  $K_{\text{sp}}$ , for silver carbonate.

.....

.....

**1**

- (c) Use the  $K_{\text{sp}}$  values on the data sheet to compare the concentrations, in  $\text{mol L}^{-1}$ , of silver ions in separate saturated solutions of silver carbonate and silver chloride.

.....

.....

.....

.....

.....

.....

.....

**3**

**Question continued on next page.**

**Question continued.****Marks**

- (d) Calculate the mass (in g) of silver chloride that will dissolve to form 1.00 L of a saturated solution.

.....

**2**

.....

.....

.....

- (e) Calculate the molar solubility of silver chloride in a 0.15 mol L<sup>-1</sup> sodium chloride solution.

.....

**2**

.....

.....

.....

**Question 27** (4 marks)**Marks**

A reaction mixture consists of 0.12 mol Br<sub>2</sub> (g) and 0.12 mol H<sub>2</sub> (g) in a 2.50 L sealed container. At a set temperature, the mixture was left to reach equilibrium according to the equation:

- (a) Calculate the initial concentration of hydrogen gas.

.....

.....

**1**

- (b) Calculate the amount, in mol, of HBr produced at equilibrium at the set temperature.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

**3**

**Question 28** (8 marks)**Marks**

When the following reaction is at equilibrium at 298 K, it is orange in colour.

- (a) Predict and explain the colour change, if any, of the reaction mixture if aqueous sodium hydroxide is added to it.

.....

.....

.....

.....

**2**

- (b) Consider the following reversible reaction at equilibrium:

- i. Predict and explain, in terms of reaction rates, the effect on the equilibrium position when the pressure increases on this system.

.....

.....

.....

.....

.....

.....

**3**

**Question continued on next page.**

**Question continued.****Marks**

- ii. Explain how an increase in temperature affects the yield of  $\text{NO}_2$  and the  $K_{\text{eq}}$  value of the reaction.

**3**

.....

.....

.....

.....

.....

.....

**LEFT BLANK INTENTIONALLY**

CANDIDATE NUMBER

**Question 29** (14 marks)

**Marks**

This question is about alcohols.

(a) Construct a chemical equation to show the complete combustion of hexan-1-ol.

.....

.....

**1**

(b) Many alcohols, including ethanol, are soluble in water.

i. Explain, with the aid of a diagram, how ethanol interacts with water.

**2**

.....

.....

ii. Using the data in the table below, explain the difference in solubility between hexan-1-ol and hexane-1,6-diol.

| Alcohol         | Solubility in water (g L <sup>-1</sup> ) |
|-----------------|------------------------------------------|
| hexan-1-ol      | 5.9                                      |
| hexane-1,6-diol | 500                                      |

.....

.....

**1**

**Question continued on next page.**

**Question continued.****Marks**

(c) Hexan-1-ol has a number of different structural isomers.

- i. **Draw**, using full structural formula, and **name** one position isomer of hexan-1-ol.

**2**

Name: .....

- ii. **Draw**, using a skeletal formula, and **name** one chain isomer of hexan-1-ol.

**2**

Name: .....

- iii. **Name** the isomer that is resistant to oxidation by acidified potassium dichromate.

.....

**1**

(d) Hexan-1-ol can be reacted with ethanoic acid to make an ester. Using structural formula, write the equation, identifying the catalyst, for this reaction.

**2**

**Question continued on next page.**

## Question continued.

## Marks

- (e) Alcohols are important in organic synthesis and can be synthesised from halogenated alkanes.

Complete the flow chart, by drawing structures of the intermediates and identifying reagents, to show how cyclohexylmethanol can be synthesised from 1-methylcyclohexene.

**Question 30** (8 marks)**Marks**

Polymers offer a wide range of properties, enabling them to be used in many different applications.

(a) Polyethene and polyvinyl chloride are two commonly used addition polymers.

- (i) Identify the feature found in these monomers that allows them to produce addition polymers.

.....

.....

**1**

- (ii) Polyvinyl chloride has a much higher melting point than polyethene. Explain this difference in melting point in terms of their structures.

.....

.....

.....

.....

.....

.....

**3**

**Question continued on next page.**

**Question continued.****Marks**

- (b) The campaign to end the use of some plastics has led scientists to develop new biodegradable polymers. Polylactic acid, PLA, is a condensation polymer which was originally developed from lactic acid for medicinal applications but can also be used for biodegradable packaging.

A section of the polymer is shown below.

- i. Draw the structure of the lactic acid monomer.

1

- ii. If a sample of PLA has a mass of 0.125 g, estimate the number of monomers used to make this sample.

3

.....

.....

.....

.....

.....

.....

**LEFT BLANK INTENTIONALLY**

Question 31 (5 marks)

Marks

The presence of calcium and magnesium ions in water can cause ‘water hardness’ that affects the taste of water. Recommendations have been made for the maximum level of calcium (80 ppm) and magnesium (30 ppm) in drinking water, and a total hardness, expressed as the sum of the calcium and magnesium concentrations, of 3 mmol/L.

A 500.00 mL sample of water was analysed using Atomic Absorption Spectroscopy (AAS). The calibration curves and sample data are given below.

|                               |      |
|-------------------------------|------|
| Sample – Calcium absorbance   | 0.20 |
| Sample – Magnesium absorbance | 0.32 |

- (a) Explain why AAS can be used as a quantitative technique for a solution that contains both ions.

.....

.....

1

Question continued on next page.

**Question continued.****Marks**

- (b) Is this water suitable for drinking? Support your conclusion with evidence.

.....

.....

.....

.....

**2**

- (c) Is this water hard? Support your conclusion with calculations.

.....

.....

.....

.....

**2**

**Question 32** (7 marks)

A sample of an unknown organic compound was analysed using mass spectrometry, IR spectroscopy and proton and carbon-13 NMR. The resulting spectra, along with the proton NMR chemical shift data, are shown below.

Question continued on next page.

Question continued.

**$^{13}\text{C}$  NMR spectrum**

**$^1\text{H}$  NMR spectrum**

Question continued on next page.

Question continued.

**$^1\text{H}$  NMR chemical shift data**

| Type of proton                                                                            | $\delta/\text{ppm}$ |
|-------------------------------------------------------------------------------------------|---------------------|
| $\text{Si}(\text{CH}_3)_4$ (TMS)                                                          | 0                   |
| $\text{R}-\text{CH}_3$                                                                    | 0.9–1.0             |
| $\text{R}-\text{CH}_2-\text{R}$                                                           | 1.2–1.5             |
| $\text{R}-\text{CHR}_2$                                                                   | 1.5–2.0             |
| $\text{R}-\text{C}\equiv\text{C}-\text{H}$ (alkyne)                                       | 2.0–3.1             |
| $-\text{CO}-\text{CH}_2-$ (aldehydes, ketones or esters)                                  | 2.1–2.7             |
| $\text{R}-\text{CH}_2-\text{NH}_2$                                                        | 2.4–3.0             |
| $\text{R}-\text{CH}_2-\text{X}$ ( $\text{X} = \text{F}, \text{Cl}, \text{Br}, \text{I}$ ) | 3.0–4.5             |
| $-\text{CH}_2-\text{O}-$ (alcohols, ethers or esters)                                     | 3.3–4.8             |
| $\text{R}-\text{OH}$                                                                      | 1–6                 |
| $\text{R}-\text{NH}_2$                                                                    | 1–5                 |
| $\text{R}_2\text{C}=\text{CHR}$ (alkene)                                                  | 4.5–7.0             |
| $\text{R}-\text{COONH}-\text{R}$ (amide)                                                  | 5–9                 |
| $\text{Ar}-\text{H}$ (aromatic)                                                           | 6.9–9.0             |
| $\text{R}-\text{CHO}$ (aldehyde)                                                          | 9.4–10.0            |
| $\text{R}-\text{COOH}$                                                                    | 9.0–13.0            |

**Question continued.****Marks**

Deduce and draw the structural formula of the unknown compound, justifying your answer with reference to the spectra.

### DATA SHEET

#### Solubility constants at 25°C

| Compound             | $K_{sp}$               | Compound            | $K_{sp}$               |
|----------------------|------------------------|---------------------|------------------------|
| Barium carbonate     | $2.58 \times 10^{-9}$  | Lead(II) bromide    | $6.60 \times 10^{-6}$  |
| Barium hydroxide     | $2.55 \times 10^{-4}$  | Lead(II) chloride   | $1.70 \times 10^{-5}$  |
| Barium phosphate     | $1.3 \times 10^{-29}$  | Lead(II) iodide     | $9.8 \times 10^{-9}$   |
| Barium sulfate       | $1.08 \times 10^{-10}$ | Lead(II) carbonate  | $7.40 \times 10^{-14}$ |
| Calcium carbonate    | $3.36 \times 10^{-9}$  | Lead(II) hydroxide  | $1.43 \times 10^{-15}$ |
| Calcium hydroxide    | $5.02 \times 10^{-6}$  | Lead(II) phosphate  | $8.0 \times 10^{-43}$  |
| Calcium phosphate    | $2.07 \times 10^{-29}$ | Lead(II) sulfate    | $2.53 \times 10^{-8}$  |
| Calcium sulfate      | $4.93 \times 10^{-5}$  | Magnesium carbonate | $6.82 \times 10^{-6}$  |
| Copper(II) carbonate | $1.4 \times 10^{-10}$  | Magnesium hydroxide | $5.61 \times 10^{-12}$ |
| Copper(II) hydroxide | $2.2 \times 10^{-20}$  | Magnesium phosphate | $1.04 \times 10^{-24}$ |
| Copper(II) phosphate | $1.40 \times 10^{-37}$ | Silver bromide      | $5.35 \times 10^{-13}$ |
| Iron(II) carbonate   | $3.13 \times 10^{-11}$ | Silver chloride     | $1.77 \times 10^{-10}$ |
| Iron(II) hydroxide   | $4.87 \times 10^{-17}$ | Silver carbonate    | $8.46 \times 10^{-12}$ |
| Iron(III) hydroxide  | $2.79 \times 10^{-39}$ | Silver hydroxide    | $2.0 \times 10^{-8}$   |
| Iron(III) phosphate  | $9.91 \times 10^{-16}$ | Silver iodide       | $8.52 \times 10^{-17}$ |
|                      |                        | Silver phosphate    | $8.89 \times 10^{-17}$ |
|                      |                        | Silver sulfate      | $1.20 \times 10^{-5}$  |

Aylward and Findlay, *SI Chemical Data* (5th Edition) is the principal source of data for this examination paper. Some data may have been modified for examination purposes.

**Infrared absorption data**

| Bond              | Wavenumber/cm <sup>-1</sup> |
|-------------------|-----------------------------|
| N—H<br>(amines)   | 3300–3500                   |
| O—H<br>(alcohols) | 3230–3550<br>(broad)        |
| C—H               | 2850–3300                   |
| O—H<br>(acids)    | 2500–3000<br>(very broad)   |
| C≡N               | 2220–2260                   |
| C=O               | 1680–1750                   |
| C=C               | 1620–1680                   |
| C—O               | 1000–1300                   |
| C—C               | 750–1100                    |

**<sup>13</sup>C NMR chemical shift data**

| Type of carbon                                                                           | δ/ppm   |

Standard atomic weights are abridged to four significant figures.

Elements with no reported values in the table have no stable nuclides.

Information on elements with atomic numbers 113 and above is sourced from the International Union of Pure and Applied Chemistry Periodic Table of the Elements (November 2016 version). The International Union of Pure and Applied Chemistry Periodic Table of the Elements (February 2010 version) is the principal source of all other data. Some data may have been modified.

# Chemistry

## Section I - Multiple Choice

Select the alternative A, B, C or D that best answers the question. Fill in the response oval completely.

**Sample:**  $2 + 4 =$  (A) 2 (B) 6 (C) 8 (D) 9  
 A ☐ B ☒ C ☐ D ☐

If you think you have made a mistake, put a cross through the incorrect answer and fill in the new answer.

A ☒ B ☒ C ☐ D ☐

If you change your mind and have crossed out what you consider to be the correct answer, then indicate the correct answer by writing the word *correct* and drawing an arrow as follows.

A ☒ B ☒ C ☐ D ☐  
 correct

Start  
Here →

1. A ☐ B ☐ C ☒ D ☐
2. A ☐ B ☐ C ☐ D ☒
3. A ☒ B ☐ C ☐ D ☐
4. A ☐ B ☐ C ☒ D ☐
5. A ☒ B ☐ C ☐ D ☐
6. A ☒ B ☐ C ☐ D ☐
7. A ☐ B ☒ C ☐ D ☐
8. A ☐ B ☐ C ☐ D ☒
9. A ☐ B ☒ C ☐ D ☐
10. A ☐ B ☐ C ☒ D ☐

11. A ☒ B ☐ C ☐ D ☐
12. A ☐ B ☒ C ☐ D ☐
13. A ☐ B ☐ C ☐ D ☒
14. A ☐ B ☐ C ☐ D ☒
15. A ☐ B ☐ C ☒ D ☐
16. A ☐ B ☐ C ☐ D ☒
17. A ☐ B ☒ C ☐ D ☐
18. A ☐ B ☐ C ☒ D ☐
19. A ☒ B ☐ C ☐ D ☐
20. A ☒ B ☐ C ☐ D ☐

## SECTION I: MULTIPLE CHOICE (20 marks)

Attempt ALL Questions  
Use the Multiple-Choice Answer Sheet.

- 1 Which of the following matches the inorganic acid and base with their correct formula?

|     | Acid                    |            | Base               |                  |
|-----|-------------------------|------------|--------------------|------------------|
| (A) | $\text{H}_2\text{PO}_4$ | phosphoric | $\text{NaOH}$      | sodium hydroxide |
| (B) | $\text{HNO}_3$          | nitrous    | $\text{NH}_3$      | ammonia          |
| (C) | $\text{NH}_4^+$         | ammonium   | $\text{CO}_3^{2-}$ | carbonate        |
| (D) | $\text{H}_2\text{SO}_3$ | sulfurous  | $\text{CaO}$       | calcium dioxide  |

- 2 Which of the following is considered to be a limitation of Arrhenius' model of acids and bases?

- (A) He did not account for acids that do not contain oxygen.
- (B) He did not account for the presence of hydrogen-containing compounds which are non-acidic in nature.
- (C) He did not recognise the importance of water as a solvent in the nature of acids and bases.
- (D) He did not recognise that some substances can act as acids or bases in the absence of solvents.

- 3 Which of the following statements with regards to acid and base strength and concentration is true?

- (A) To neutralise a given amount of strong base, the number of moles of a monoprotic weak acid is the same as that required for a monoprotic strong acid.
- (B) The same concentration of strong and weak monoprotic acids will contain the same chemical amount of hydrogen ions.
- (C) A weak acid is unable to neutralise a strong base.
- (D) The pOH of a strong concentrated base will be greater than that of a weak dilute acid.

- 4 If the pH of a solution was shown to be 10.5, what could we conclude about the following parameters?
- (A) The pOH will be  $10^{-3.5}$
  - (B) The  $H^+$  concentration will be 1.02
  - ☒ (C) The  $OH^-$  concentration will be  $3.16 \times 10^{-4}$
  - (D) The  $H^+$  concentration x the  $OH^-$  concentration will be  $10^{14}$
- 5 Which of the following statements correctly describes the relationship between the strength of an acid, its hydrogen ion concentration, its pH and its  $pK_a$ ?
- ☒ (A) The stronger the acid, the lower the  $pK_a$  value.
  - (B) A strong acid will have a  $pK_a$  somewhere between 0.001 and 1000.
  - (C) An acid with a low pH will have a very large  $pK_a$ .
  - (D) The greater the  $K_a$ , the larger the  $pK_a$  value.
- 6 If a monoprotic acid has pH value of 3.2 and a concentration of 0.15 mol/L, what will its  $K_a$  value be closest to?
- ☒ (A)  $2.7 \times 10^{-6}$
  - (B)  $6.3 \times 10^{-4}$
  - (C) 5.6
  - (D)  $3.8 \times 10^5$

- 7 Solid potassium amide  $KNH_2$  reacts with water according to the equation:

The acid and its respective conjugate base in this reaction are:

- (A)  $K^+$  and KOH
- ☒ (B)  $H_2O$  and  $OH^-$
- (C)  $NH_2^-$  and  $NH_3$
- (D)  $NH_3$  and  $NH_2^-$

- 8 A reaction in dynamic equilibrium is one in which:
- (A) the concentration of the product is always independent of reaction conditions
  - (B) the enthalpy changes for the forward and the reverse reactions are equal
  - (C) the activation energies for the forward and the reverse reactions are equal
  - ☒ (D) the rates of the forward and the reverse reactions are equal
- 9 Iodine was added to 50 mL of each of two immiscible solvents X and Y in a separating funnel as shown below.

After shaking, the following equilibrium was established:

An extra 10 mL of solvent X was added, the mixture shaken and equilibrium was allowed to re-establish. Which of the following statements is correct?

- (A) The concentration of I<sub>2</sub> in Y increases
  - ☒ (B) The concentration of I<sub>2</sub> in Y decreases
  - (C) The equilibrium constant increases
  - (D) The equilibrium constant decreases
- 10 Photosynthesis is not considered to be an equilibrium reaction because:
- (A) it has a large negative  $\Delta H$  value
  - (B) it has a small negative  $\Delta S$  value
  - ☒ (C) it has a large positive  $\Delta G$  value
  - (D) it has a zero  $\Delta G$  value

- 11 Will lead(II) chloride precipitate when 50 mL of 0.10 M  $\text{Pb}(\text{NO}_3)_2$  solution is mixed with 50 mL of 0.10 M NaCl solution?

- (A) Yes, because the ion product is greater than the  $K_{\text{sp}}$ .  
(B) Yes, because the  $K_{\text{sp}}$  is greater than the ion product.  
(C) No, because the ion product is smaller than the  $K_{\text{sp}}$ .  
(D) No, because the  $K_{\text{sp}}$  is smaller than the ion product.

- 12 The reaction:

has an equilibrium constant of 3.9 at 950 °C.

The equilibrium concentrations of CO (g),  $\text{H}_2$  (g) and  $\text{H}_2\text{O}$  (g) are given in the table.

| Substance                | Equilibrium concentration (mol L <sup>-1</sup> ) |
|--------------------------|--------------------------------------------------|
| CO (g)                   | $5.0 \times 10^{-2}$                             |
| $\text{H}_2$ (g)         | $1.0 \times 10^{-2}$                             |
| $\text{H}_2\text{O}$ (g) | $4.0 \times 10^{-3}$                             |

What is the equilibrium concentration of  $\text{CH}_4$  (g), in mol L<sup>-1</sup>, at 950 °C?

- (A)  $2.0 \times 10^{-7}$   
(B)  $4.9 \times 10^{-5}$   
(C)  $3.1 \times 10^{-5}$   
(D)  $4.9 \times 10^{-1}$
- 13 A solution is made by dissolving solid sodium hydroxide and barium hydroxide in water. Which of the following must be true regarding the concentrations of each of the ions in solution formed?

- (A)  $[\text{Na}^+] = [\text{Ba}^{2+}] = [\text{OH}^-]$   
(B)  $[\text{Na}^+] = [\text{Ba}^{2+}] = 3 [\text{OH}^-]$   
(C)  $[\text{Na}^+] + 2 [\text{Ba}^{2+}] = 3 [\text{OH}^-]$   
(D)  $[\text{Na}^+] + 2 [\text{Ba}^{2+}] = [\text{OH}^-]$

- 14 Complete combustion of an organic compound forms 40 mL of carbon dioxide and 40 mL of water vapour, under the same conditions of temperature and pressure. Which of the following could be the molecular formula of the organic compound?

- (A)  $C_3H_8$   
(B)  $C_2H_2O$   
(C)  $C_2H_3N$   
(D)  $C_2H_4O$

- 15 Four atoms, 1–4, are labelled in the structure below.

Which atom has a trigonal **planar** arrangement of bonds around it?

- (A) Atom 1  
(B) Atom 2  
(C) Atom 3  
(D) Atom 4

- 16 Which compound(s) is/are structural isomer(s) of  $C_6H_{12}O_2$ ?

- I hexanoic acid  
II ethyl butanoate  
III propyl propanoate

- (A) Only I  
(B) I and II only  
(C) II and III only  
(D) All of I, II and III

17 What is the IUPAC name of the following compound?

- (A) 1,1,2-trimethylpentane  
(B) 2,3-dimethylhexane  
(C) 4,5-dimethylhexane  
(D) 4,5,5-trimethylpentane
- 18 In the infra-red spectrum of an organic compound, a strong band is observed at  $3000\text{ cm}^{-1}$ . The most likely explanation for this band is:
- (A) the electrons absorb this IR radiation and are excited to a higher orbital.  
(B) protons absorb the radiation at this frequency and change their spin.  
(C) absorption of this IR radiation wavenumber causes vibrations of the C-H bonds.  
(D) absorption of this wavenumber of IR radiation causes a substitution reaction.
- 19 Bromine water can be used to test for the presence of which of the following organic functional groups?
- (A) Carbon-carbon double bonds  
(B) Hydroxyl groups  
(C) Carboxylic acids  
(D) Aldehydes and ketones

- 20 The proton NMR spectrum for butan-2-one is shown below, along with a numbered structure of butan-2-one.

Identify the position (1-4) of hydrogen atoms that are responsible for the singlet peak at 2.1 ppm.

- (A) 1  
(B) 2  
(C) 3  
(D) 4

**SECTION II: 80 marks**

Attempt ALL Questions  
Write your answer in the space provided.

**MARKING SCHEME - AUSD**

CANDIDATE NUMBER

**Question 21 (4 marks)****Marks**

Acids react with carbonates in predictable ways. Formic acid has the formula HCOOH and its  $pK_a$  is 3.75.

- (a) Write a balanced chemical equation to represent the reaction between formic acid and sodium carbonate.

1

- (b) State whether you would expect the salt formed in part (a) to be acidic, neutral or basic. Explain your answer including an appropriate equation.

3 MARKS \* From  $pK_a$  we can tell that HCOOH is a weak acid 3

AND \* so produces  $\text{OH}^-$  or accepts protons

AND \* therefore salt is basic

2 MARKS Either \* equation above

OR \* produces  $\text{OH}^-$  or accepts protons

AND \* salt is basic

1 MARK identifies any piece of relevant information given above.

**Question 22** (3 marks)**Marks**

The dihydrogen phosphate ion has the formula  $\text{H}_2\text{PO}_4^-$ .

(a) Write an equation to show dihydrogen phosphate reacting with:

(i) an acid

(ii) a base

If  $\text{H}_2\text{PO}_4^-$  was shown to be used as both acid & base in equations above then a maximum of 1 mark given.

(b) Identify the term that we use to describe substances that can act as both acids and bases, such as dihydrogen phosphate.

Amphiprotic

 1

**Question 23** (4 marks)**Marks**

The equipment shown below may be used to measure the enthalpy of neutralisation.

10.0 mL of 0.500 M solution of HCl are mixed with 10.0 mL of 0.500 M solution of NaOH in the cup shown. The enthalpy change for this reaction is  $-55.8 \text{ kJ mol}^{-1}$ .

- (a) If the initial temperature of the reactants was  $25.0^\circ\text{C}$ , calculate the final temperature once the reaction had finished.

$$\Delta T = \frac{\Delta H \times n}{-mc}$$

$$= \frac{-55800 \times 0.005}{-20 \times 4.18}$$

$$= 3.337 \text{ K}$$

Final Temp =  $25 + 3.337$   
 $= 28.337$   
 $= 28.3$  to 3 sig fig

One mark lost for each mistake.

- (b) State one assumption you made in this calculation.

\* All the energy produced by the reaction has been absorbed by the measured environment and none escaped  
 OR \* The specific heat capacity of the solution was  $4.18 \text{ J g}^{-1} \text{ K}^{-1}$   
 OR \* The density of the solution was  $1 \text{ g/mL}$

**Question 24** (5 marks)

**Marks**

50.0 mL of a solution of HCl with pH 3.0 was mixed with 30.0 mL of a solution of HNO<sub>3</sub> with pH 5.0.

(a) Calculate the pH of the resultant solution.

|                           | HCl                  | HNO <sub>3</sub>     |        |
|---------------------------|----------------------|----------------------|--------|
| pH                        | 3                    | 5                    |        |
| H <sup>+</sup> conc       | 10 <sup>-3</sup>     | 10 <sup>-5</sup>     | Step 1 |
| vol                       | 0.05L                | 0.03L                |        |
| n                         | 5 x 10 <sup>-5</sup> | 3 x 10 <sup>-7</sup> | Step 2 |
| n total                   | 0.08L                |                      | Step 3 |
| H <sup>+</sup> conc total | 0.00062875M          |                      | Step 4 |
| pH                        | 3.2                  |                      | Step 5 |

**3 marks - 5 correct steps**

**2 marks - 4 correct steps**

**1 mark – 1 to 3 correct steps**

(b) Explain how the pH and H<sup>+</sup> concentration of the resultant solution would differ from that calculated above, if ethanoic acid was used instead of nitric acid.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>2 marks</b> | $\text{CH}_3\text{COO}^- + \text{H}^+ \rightleftharpoons \text{CH}_3\text{COOH}$ <ul style="list-style-type: none"> <li>Addition of H<sup>+</sup> from HCl would shift equilibrium to RHS</li> <li>therefore decreasing the H<sup>+</sup> conc and increasing the pH</li> </ul> <p style="text-align: center;">OR having no effect on the pH due to the relative concs of the 2 acids.</p> <p>NB 2<sup>nd</sup> point must follow on from first logical explanation</p> |
| <b>1 mark</b>  | <ul style="list-style-type: none"> <li>Addition of H<sup>+</sup> from HCl would shift equilibrium to RHS</li> <li>OR (see below)</li> </ul>                                                                                                                                                                                                                                                                                                                             |

The fact that ethanoic acid is weak and only partially ionises does not EXPLAIN the difference since the pH and hence original H<sup>+</sup> conc of the ethanoic and nitric acids was initially the same.  
This answer was awarded 1 mark.

**Question 25** (9 marks)**Marks**

An acid / base titration was undertaken using an electronic pH meter. The resultant data is shown in the table below.

| Volume of acid added (mL) | pH  |
|---------------------------|-----|
| 40                        | 9.4 |
| 88                        | 8.6 |
| 94                        | 8.0 |
| 98                        | 7.6 |
| 101                       | 2.2 |
| 104                       | 1.4 |
| 116                       | 1.2 |
| 140                       | 0.8 |

(a) Plot the data provided on the grid below and draw a line of best fit.

Question continued on next page.

**Question 25 continued**
**Marks**

- (b) By analysing your graph, deduce the strength of the base used in this titration.

|                |                                                                 |                                                                                                                                                                                                      |
|----------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3 marks</b> | <b>Base is weak because -<br/>any 2 of the following points</b> | <ul style="list-style-type: none"> <li>• Equivalence point is around pH 4.5 - 5</li> <li>• Point of inflection is around pH 4.5 - 5</li> <li>• Salt produced is acidic, around pH 4.5 - 5</li> </ul> |
| <b>2 marks</b> | <b>Base is weak because -<br/>any 1 of the following points</b> | <ul style="list-style-type: none"> <li>• Equivalence point is around pH 4.5 - 5</li> <li>• Point of inflection is around pH 4.5 - 5</li> <li>• Salt produced is acidic, around pH 4.5 - 5</li> </ul> |
| <b>1 mark</b>  | <b>Any of the following points<br/><br/>OR</b>                  | <ul style="list-style-type: none"> <li>• Equivalence point is around pH 4.5 - 5</li> <li>• Point of inflection is around pH 4.5 - 5</li> <li>• Salt produced is acidic, around pH 4.5 - 5</li> </ul> |
|                |                                                                 | <b>Base is weak because the initial pH is 9.4<br/>(this would also be true for a dilute strong base)</b>                                                                                             |

- (c) Titrations can also be done by means of a chemical indicator in place of a pH meter. These indicators are usually weak acids in equilibrium with their conjugate bases, at roughly equal concentrations when they change colour. Explain why it is important during titrations to keep the amount of indicator added to a minimum.

|                |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Question 26 (9 marks)

Marks

Silver carbonate and silver chloride are only slightly soluble in water.

In the following, assume that the temperature is a constant 25°C.

- (a) Write an ionic equation for the dissociation of solid silver carbonate,  $\text{Ag}_2\text{CO}_3$ , in water.

1

- (b) Write the solubility product expression,  $K_{sp}$ , for silver carbonate.

$$K_{sp} = [\text{Ag}^+]^2 [\text{CO}_3^{2-}]$$

1

- (c) Use the  $K_{sp}$  values on the data sheet to compare the concentrations, in  $\text{mol L}^{-1}$ , of silver ions in separate saturated solutions of silver carbonate and silver chloride.

$$\text{Ag}_2\text{CO}_3 \quad [\text{Ag}^+] = 4x^3 = 8.46 \times 10^{-12}$$

3

$$x = 1.3 \times 10^{-4} \text{ mol L}^{-1} \text{ (2)}$$

$$\therefore [\text{Ag}^+] = 2 \times 1.3 \times 10^{-4} = 2.6 \times 10^{-4} \text{ M (1)}$$

$$\text{AgCl} \quad [\text{Ag}^+] = x^2 = 1.77 \times 10^{-10}$$

$$x = 1.33 \times 10^{-5} \text{ mol L}^{-1} \text{ (1)}$$

Comparison:  $\text{Ag}_2\text{CO}_3$  has a higher concentration of  $\text{Ag}^+$  ions ] (1)

Question continued on next page.

## Question continued.

## Marks

- (d) Calculate the mass (in g) of silver chloride that will dissolve to form 1.00 L of a saturated solution.

$$\begin{aligned} m(\text{AgCl}) &= 1.33 \times 10^{-5} \times 143.4 \\ &= 1.91 \times 10^{-3} \text{ g} \end{aligned}$$

2

- (e) Calculate the molar solubility of silver chloride in a 0.15 mol L<sup>-1</sup> sodium chloride solution.

$$\begin{aligned} \text{solubility} &= [\text{Ag}^+][\text{Cl}^-] = 1.77 \times 10^{-10} \\ \text{when } [\text{Cl}^-] &= 0.15 \end{aligned}$$

2

$$\text{solubility} = \frac{1.77 \times 10^{-10}}{0.15}$$

$$= 1.18 \times 10^{-9} \text{ mol L}^{-1}$$

$$= 1.2 \times 10^{-9} \text{ mol L}^{-1}$$

**Question 27** (4 marks)**Marks**

A reaction mixture consists of 0.12 mol  $\text{Br}_2(\text{g})$  and 0.12 mol  $\text{H}_2(\text{g})$  in a 2.50 L sealed container. At a set temperature, the mixture was left to reach equilibrium according to the equation:

- (a) Calculate the initial concentration of hydrogen gas.

$$\text{initial } [\text{H}_2] = \frac{0.12}{2.5} = 0.048 \text{ mol/L}^{-1}$$

1

- (b) Calculate the amount, in mol, of HBr produced at equilibrium at the set temperature.

3

|   |         |         |     |
|---|---------|---------|-----|
| I | 0.048   | 0.048   | 0   |
| C | -x      | -x      | +2x |
| E | 0.048-x | 0.048-x | 2x  |

$\nwarrow$  ignore as  $\ll 0.048$

$$\therefore K = \frac{(2x)^2}{(0.048)^2} = 1.9 \times 10^{-5}$$

$$4x^2 = 4.377 \times 10^{-8}$$

$$x^2 = 1.094 \times 10^{-8}$$

$$x = 1.046 \times 10^{-4} \text{ M}$$

$$\therefore [\text{HBr}] = 2 \times 1.046 \times 10^{-4}$$

$$= 2.09 \times 10^{-4} \text{ M}$$

$$n(\text{HBr}) = 2.09 \times 10^{-4} \times 2.5$$

$$= 5.2 \times 10^{-4} \text{ mol}$$

## Question 28 (8 marks)

Marks

When the following reaction is at equilibrium at 298 K, it is orange in colour.

- (a) Predict and explain the colour change, if any, of the reaction mixture if aqueous sodium hydroxide is added to it.

Prediction = Turns yellow ①

Explanation:  $\text{OH}^-$  neutralises  $\text{H}^+$  reducing  $[\text{H}^+]$  ①

OR ② Equilibrium shifts to right to counteract loss of  $\text{H}^+$  by  $\text{OH}^-$ .

2

- (b) Consider the following reversible reaction at equilibrium:

- i. Predict and explain, in terms of reaction rates, the effect on the equilibrium position when the pressure increases on this system.

PREDICTION: Shift left ①

3

EXPLANATION: • Increased pressure increases  $[\text{N}_2\text{O}_4]$  and  $[\text{NO}_2]$  but increases  $[\text{NO}_2]$  more. ①

• This is because the mole ratio of  $\text{NO}_2 : \text{N}_2\text{O}_4$  is 2:1 so increase rate of collisions ①  
A shift to the left as more  $\text{NO}_2$  molecules are colliding successfully than  $\text{N}_2\text{O}_4$ .

Question continued on next page.

1 mark for  
When pressure increases  
the effect on  
RATE of  $\text{NO}_2$  is  
greater but both  
increase

1 mark for the  
reason in terms  
of mole ratio

## Question continued.

## Marks

- ii. Explain how an increase in temperature affects the yield of  $\text{NO}_2$  and the  $K_{\text{eq}}$  value of the reaction.

3

1. Increasing temperature favours the endothermic reaction, in this case the forward reaction. ①
2. Increasing forward reaction increases the yield of  $\text{NO}_2$ . ①
3.  $K_{\text{eq}}$  Value will increase as  $[\text{NO}_2]$  is the <sup>numerator</sup> ~~denominator~~ in the  $K$  expression, so as it gets larger so does the  $K_{\text{eq}}$  value, ①  
OR Gives the equilibrium expression  
$$K = \frac{[\text{NO}_2]^2}{[\text{N}_2\text{O}_4]}$$
  
\* Revised #3.  $K$  is increased is given the mark

## Question 29 (14 marks)

Marks

This question is about alcohols.

- (a) Construct a chemical equation to show the complete combustion of hexan-1-ol.

IGNORE : STATE SYMBOLS

ACCEPT : MULTIPLES

ACCEPT :  $\text{C}_6\text{H}_{14}\text{O}$  or  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$  for hexan-1-ol

- (b) Many alcohols, including ethanol, are soluble in water.

- i. Explain, with the aid of a diagram, how ethanol interacts with water.

2

Ethanol molecules form H-bonds with water

NOTE : LONE PAIR IS NOT REQUIRED

ACCEPT : — / ---- / ~~~ / |||| For H BOND.

NOTE : MUST SHOW  $\delta+$  ON H AND  $\delta-$  ON O INVOLVED

- ii. Using the data in the table below, explain the difference in solubility between hexan-1-ol and hexane-1,6-diol.

| Alcohol         | Solubility in water ( $\text{g L}^{-1}$ ) |
|-----------------|-------------------------------------------|
| hexan-1-ol      | 5.9                                       |
| hexane-1,6-diol | 500                                       |

More H bonds can form per molecule

1

NOTE : Error carried forward marks awarded

ACCEPT : More dipole-dipole interactions (if incorrect in 29b)

ACCEPT : More polar O-H groups, more interactions with water

Question continued on next page.

REJECT : More O-H bonds without explanation

REJECT : More polar

## Question continued.

## Marks

(c) Hexan-1-ol has a number of different structural isomers.

- i. **Draw**, using full structural formula, and **name** one position isomer of hexan-1-ol.

2

- ii. **Draw**, using skeletal formula, and **name** one chain isomer of hexan-1-ol.

2

- iii. **Name** the isomer that is resistant to oxidation by acidified potassium dichromate.

1

(d) Hexan-1-ol can be reacted with ethanoic acid to make an ester. Using structural formula, write the equation for this reaction.

2

Question continued on next page.

MARK 1 : Equation  
 MARK 2 : conc.  $\text{H}_2\text{SO}_4$  catalyst

## Question continued.

## Marks

- (e) Alcohols are important in organic synthesis and can be synthesised from halogenated alkanes.

Complete the flow chart, by drawing structures of the intermediates and identifying reagents, to show how cyclohexylmethanol can be synthesised from 1-methylcyclohexene.

NOTE: 2 marks awarded if:

- 1 correct structure + hydration conditions correct
- 2 correct structures + hydration conditions incorrect
- 2 correct structures in wrong order + hydration conditions correct.

NOTE: If product 1 and product 2 are wrong way round deduct 1 mark

$\text{H}_2\text{O}$ ,  $\text{H}_3\text{PO}_4/\text{H}_2\text{SO}_4$  or dil.  $\text{H}_3\text{PO}_4/\text{H}_2\text{SO}_4$

**Question 30** (8 marks)**Marks**

Polymers offer a wide range of properties, enabling them to be used in many different applications.

- (a) Polyethene and polyvinyl chloride are two commonly used addition polymers.
- (i) Identify the feature found in these monomers that allows them to produce addition polymers.

Carbon - carbon double bond

1

ACCEPT: double bond between carbons

ACCEPT: Alkene functional group

REJECT: Double bond

- (ii) Polyvinyl chloride has a much higher melting point than polyethene. Explain this difference in melting point in terms of their structures.

C - Cl bonds are polar / strands

3

are polar (M1)

Permanent dipole-dipole interactions

stronger than dispersion forces (M2)

More energy required to separate strands (M3)

ACCEPT: stronger dispersion forces (max 1 mark)

Question continued on next page.

## Question continued.

## Marks

- (b) The campaign to end the use of some plastics has led scientists to develop new biodegradable polymers. Polylactic acid, PLA, is a condensation polymer which was originally developed for medicinal applications but can also be used for biodegradable packaging.

A section of the polymer is shown below.

- i. Draw the structure of lactic acid.

RESULT :

1

- ii. A sample of PLA has a mass of 0.125 g, estimate the number of monomers used to make this sample.

ACCEPT:  
mass of monomer  
- mol of unit

NOTE: Error  
carried forward  
marks awarded

Formula of repeating unit :  $C_3H_4O_2$  (M1)<sub>3</sub>

Mr of repeating unit =  $72.062 \text{ g mol}^{-1}$

$n(\text{repeating unit}) = \frac{0.125 \text{ g}}{72.062 \text{ g mol}^{-1}}$

$= 0.001735 \text{ mol}$  (M2)

no. of monomers = no. of repeating unit

$= 1.04 \times 10^{21}$  (M3)

**Question 31** (5 marks)**Marks**

The presence of calcium and magnesium ions in water can cause 'water hardness' that affects the taste of water. Recommendations have been made for the maximum level of calcium (80 ppm) and magnesium (30 ppm) in drinking water, and a total hardness, expressed as the sum of the calcium and magnesium concentrations, of 3 mmol/L.

A 500.00 mL sample of water was analysed using Atomic Absorption Spectroscopy (AAS). The calibration curves and sample data are given below.

**CALIBRATION CURVES**

|                               |      |
|-------------------------------|------|
| Sample – Calcium absorbance   | 0.20 |
| Sample – Magnesium absorbance | 0.32 |

- (a) Explain why AAS can be used as a quantitative technique for a solution that contains both ions.

*Different ions absorb different  $\lambda$ 's from specialised lamps & will not interfere with each other.*

1

Question continued on next page.

## Question continued.

## Marks

(b) Is this water suitable for drinking? Support your conclusion with evidence.

(1) From graph;  $Mg^{2+}$  40 ppm  
 $Ca^{2+}$  49-50 ppm. 2

(1)  $Mg^{2+} > \text{limit}$ , so not suitable for drinking

(c) Is this water hard? Support your conclusion with calculations.

(1)  $Mg^{2+} \frac{40 \times 10^{-3}}{24.31} = 1.65 \text{ mmol L}^{-1}$   
 $Ca^{2+} \frac{50 \times 10^{-3}}{40.08} = 1.25 \text{ mmol L}^{-1}$   
 $2.90 \text{ mmol L}^{-1}$  2

(1) it is not hard as  $2.9 < 3.0$

- \* Must have a calculation that involves mmol/L
- \* Note: ppm = mg/L so 500 mL is not relevant.
- \* Must compare to 3 mmol/L
- \* CE if mmol L<sup>-1</sup> calc is wrong, but made correct comparison

**Question 32** (7 marks)

A sample of an unknown organic compound was analysed using mass spectrometry, IR spectroscopy and proton and carbon-13 NMR. The resulting spectra, along with the proton NMR chemical shift data, are shown below.

Question continued on next page.

Question continued.

$^{13}\text{C}$  NMR spectrum

$^1\text{H}$  NMR spectrum

Question continued on next page.

## Question continued.

**<sup>1</sup>H NMR chemical shift data**

| Type of proton                                       | δ/ppm    |
|------------------------------------------------------|----------|
| Si(CH <sub>3</sub> ) <sub>4</sub> (TMS)              | 0        |
| R-CH <sub>3</sub>                                    | 0.9–1.0  |
| R-CH <sub>2</sub> -R                                 | 1.2–1.5  |
| R-CHR <sub>2</sub>                                   | 1.5–2.0  |
| R-C≡C-H (alkyne)                                     | 2.0–3.1  |
| -CO-CH <sub>2</sub> - (aldehydes, ketones or esters) | 2.1–2.7  |
| R-CH <sub>2</sub> -NH <sub>2</sub>                   | 2.4–3.0  |
| R-CH <sub>2</sub> -X (X = F, Cl, Br, I)              | 3.0–4.5  |
| -CH <sub>2</sub> -O- (alcohols, ethers or esters)    | 3.3–4.8  |
| R-OH                                                 | 1–6      |
| R-NH <sub>2</sub>                                    | 1–5      |
| R <sub>2</sub> C=CHR (alkene)                        | 4.5–7.0  |
| R-COONH-R (amide)                                    | 5–9      |
| Ar-H (aromatic)                                      | 6.9–9.0  |
| R-CHO (aldehyde)                                     | 9.4–10.0 |
| R-COOH                                               | 9.0–13.0 |

only CH<sub>3</sub> near  
C=O.

shift means  
CH<sub>2</sub>-O-C=O

not an  
aldehyde.

### Question 32

Deduce and draw the structural formula of the unknown compound, justifying your answer with reference to the spectra.

| Marks | Criteria                                                                                                                                                                                                                          |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7     | <ul style="list-style-type: none"><li>• Draws ethyl ethanoate</li><li>• Clear and logical justification with reference to all 4 spectra</li><li>• Eliminates alternatives e.g. methyl propanoate using proton NMR or MS</li></ul> |
| 6     | <ul style="list-style-type: none"><li>• As for 7 marks less 1 point (usually alternatives)</li></ul>                                                                                                                              |
| 4-5   | <ul style="list-style-type: none"><li>• Correctly relates most spectral data to structure drawn, even if incorrect structure has been given</li></ul>                                                                             |
| 3     | <ul style="list-style-type: none"><li>• Identifies information from all 4 spectra</li></ul>                                                                                                                                       |
| 1-2   | <ul style="list-style-type: none"><li>• Identifies some relevant information from any spectra.</li></ul>                                                                                                                          |

Marked holistically

MP = did not justify why the structure is not methyl propanoate

Too many boys just identified a list of features and did not relate them to the structure, nor justified how these features helped establish their structure.

Note it was possible to guess correct structure and still not answer the question, so less than 7 was given.
