2

Question 12 (10 marks) Start a NEW Writing Booklet.

Question 12 continues on page 10

Question 12 (continued)

(c) Consider the statement $P(n)$:

$$2^0 + 2^1 + 2^2 + \dots + 2^{n-1} = 2^n - 1 \text{ for integers } n \geq 1.$$

An attempted proof of this statement by induction is given below.

Proof:

Assume the statement is true for $n = k + 1$.

$$\text{That is, } 2^0 + 2^1 + 2^2 + \dots + 2^{k-1} + 2^k = 2^{k+1} - 1 \quad (1)$$

Next, we shall show it is true for $n = k$ by noting that if

$$2^0 + 2^1 + 2^2 + \dots + 2^{k-1} + 2^k = 2^{k+1} - 1$$

is true, then

$$2^0 + 2^1 + 2^2 + \dots + 2^{k-1} + 2^k = 2 \times 2^k - 1$$

$$2^0 + 2^1 + 2^2 + \dots + 2^{k-1} + 2^k = 2^k + 2^k - 1$$

Now subtracting 2^k from both sides of this equation, we have

$$2^0 + 2^1 + 2^2 + \dots + 2^{k-1} = 2^k - 1$$

Which is true by statement (1). Therefore, by the principle of induction, the statement $P(n)$ is true.

Give two reasons why the given proof is incorrect and does not prove $P(n)$.

Question 16

(a) Prove

$$\sin 3A = 3 \sin A - 4 \sin^3 A$$

$$\text{LHS} = \sin 3A -$$

$$= \sin(2A + A)$$

$$= \sin 2A \cos A + \cos 2A \sin A$$

$$= 2 \sin A \cos A \cos A + (1 - 2 \sin^2 A) \sin A$$

$$= 2 \sin A \cos^2 A + \sin A - 2 \sin^3 A$$

$$= 2 \sin A (1 - \sin^2 A) + \sin A - 2 \sin^3 A$$

$$= \underbrace{2 \sin A - 2 \sin^3 A} + \underbrace{\sin A - 2 \sin^3 A}$$

$$= 3 \sin A - 4 \sin^3 A$$

$$= \text{RHS}$$

$$\therefore \sin 3A = 3 \sin A - 4 \sin^3 A$$

(11) Hence show $6x^3 - 8x^3 = 1$ has roots ^①

$$\sin \frac{\pi}{18}, \sin \frac{5\pi}{18}, \sin \frac{23\pi}{18}$$

a cubic has at most 3 real solutions

So if we find 3 distinct solutions

we have found them all (as degree 3)

$$\text{let } x = \sin A \text{ — ②}$$

$$\text{sub ② in ① } 6 \sin^3 A - 8 \sin^3 A = 1$$

$$3 \sin A - 4 \sin^3 A = \frac{1}{2}$$

3

Well done generally.

$\frac{1}{2}$ mk.

$\frac{1}{2}$ mk

Some students left out essential

1 mark.

1

only a handful of students achieved 3 marks. Most received 2 as didn't show at most 3 solutions

∴ using part (a) $\sin 3A = 3\sin A - 4\sin^3 A$.

$$\sin 3A = \frac{1}{2}$$

Sine is positive in Q1 & Q2

$$\sin \frac{\pi}{6} = \frac{1}{2}$$

$$\therefore R = \frac{\pi}{6}$$

$$\therefore 3A = \frac{\pi}{6} + 2n(\pi) \text{ or } 3A = (\pi - \frac{\pi}{6}) + 2n\pi$$

$$A = \frac{\pi}{18} + \frac{2n\pi}{3} \text{ or } A = \frac{5\pi}{18} + \frac{2n\pi}{3}$$

$$\therefore A = \left(\frac{\pi}{18}\right), \left(\frac{5\pi}{18}\right), \frac{13\pi}{18}, \frac{17\pi}{18}, \dots, \frac{19\pi}{18}, \dots, \left(\frac{25\pi}{18}\right), \dots$$

There will be repeats but only 3 distinct solutions...

∴ the solutions are.

$$\sin \frac{\pi}{18}, \sin \frac{5\pi}{18}, \text{ and } \sin \frac{25\pi}{18}$$

(b) From formula sheets, $\underline{u \cdot v} = |u||v| \cos \theta$.

$$\therefore p \cdot q = |p||q| \cos \theta$$

$$= 1 \times 1 \times \cos(\alpha + \beta)$$

$$\therefore p \cdot q = \cos(\alpha + \beta)$$

many students just substituted in the answers given...

This is a
