QUESTION SIXTEEN (14 marks) Start a new answer booklet.

Marks

- (a) (i) The function
- $f(x)$
- is continuous for all
- $x \in \mathbf{R}$
- .

2

Use the substitution $x = \pi - u$ to show that

$$\int_0^\pi x f(\sin x) dx = \frac{\pi}{2} \int_0^\pi f(\sin x) dx.$$

- (ii) Hence evaluate
- $\int_0^\pi (1 + 2x) \frac{\sin^3 x}{1 + \cos^2 x} dx$
- .

3

- (b) An object of unit mass is attached to a spring. When the object is pulled and released, it experiences a force proportional to its displacement x metres, where $x = 0$ is taken as the centre of motion. The object moves in simple harmonic motion and the acceleration of the object is given by $\ddot{x} = -P^2x$ for some constant $P > 0$.

When the spring and object are submerged in a liquid, the object also experiences a resistive force proportional to its velocity. Thus, the acceleration of the object is given by

$$\ddot{x} = -P^2x - Q\dot{x} \quad (*)$$

for some constant $Q > 0$.

The spring is stretched and the object is released. A timer is started once the object reaches $x = A$, where $A > 0$. That is, $x = A$ when $t = 0$. A graph of the displacement of the object submerged in liquid after t seconds is shown as follows:

The following questions relate to the motion of the object while it is submerged in liquid and $t \geq 0$.

- (i) Show that $x = Ae^{-kt} \cos nt$ is a solution to the differential equation (*) if $k = \frac{1}{2}Q$ and $n = \frac{1}{2}\sqrt{4P^2 - Q^2}$. You may assume that $4P^2 - Q^2 > 0$.

3

- (ii) Let x_r be the displacement of the object the r th time that it is instantaneously at rest.

2

Show that $x_1 = -Ae^{\frac{k\alpha}{n}} \cos \alpha \times e^{-\frac{k\pi}{n}}$, where $\alpha = \tan^{-1} \left(\frac{k}{n} \right)$.

- (iii) The value of the coefficient P relates to the stiffness of the spring, while the value of the coefficient Q relates to the viscosity of the liquid.

4

Show that the total distance that the object will move while submerged in a liquid for $t \geq 0$ is dependent only on the value of the ratio $\frac{P}{Q}$.

Particle first comes to rest when $t = \frac{1}{n}(\pi - \alpha)$

$$\therefore x_1 = Ae^{-k \times \frac{1}{n}(\pi - \alpha)} \cos\left(n \times \frac{1}{n}(\pi - \alpha)\right)$$

$$= Ae^{-\frac{k\pi}{n} + \frac{k\alpha}{n}} \cos(\pi - \alpha)$$

$$= -Ae^{\frac{k\alpha}{n}} \cos \alpha \times e^{-\frac{k\pi}{n}} \quad \checkmark, \text{ since } \cos(\pi - \alpha) = -\cos \alpha$$

(iii) When $t = \frac{1}{n}(2\pi - \alpha)$:

$$x_2 = Ae^{-k \times \frac{1}{n}(2\pi - \alpha)} \cos\left(n \times \frac{1}{n}(2\pi - \alpha)\right)$$

$$= Ae^{\frac{k\alpha}{n}} \cos(2\pi - \alpha) \times e^{-\frac{2k\pi}{n}} \quad \checkmark$$

$$= Ae^{\frac{k\alpha}{n}} \cos \alpha \times e^{-\frac{2k\pi}{n}} \quad \text{since } \cos(2\pi - \alpha) = \cos \alpha$$

(some correct exploration of x_2)

Note that for successive values of t , $\cos nt$ will alternate between $\cos \alpha$ and $-\cos \alpha$. Each successive value of x_r can be found by multiplying the previous by $-e^{-\frac{k\pi}{n}}$.

$$\therefore |x_r| = |x_{r-1}| \times e^{-\frac{k\pi}{n}}, \text{ forming a G.P.}$$

Let total distance travelled by D metres.

$$\begin{aligned} \text{Then } D &= A + 2|x_1| + 2|x_2| + 2|x_3| + \dots \\ &= A + 2(|x_1| + |x_2| + |x_3| + \dots) \end{aligned}$$

$$= A + 2 \times \frac{A e^{\frac{kx}{n}} \cos \alpha e^{-\frac{k\pi}{n}}}{1 - e^{-\frac{k\pi}{n}}}$$

$$= A \left(1 + \frac{2A e^{\frac{kx}{n}} \cos \alpha}{e^{\frac{k\pi}{n}} - 1} \right)$$

where $\alpha = \tan^{-1}\left(\frac{k}{n}\right)$

Note that for a given A , D is dependent on $\frac{k}{n}$.

$$\text{Now } \frac{k}{n} = \frac{\frac{1}{2}Q}{\frac{1}{2}\sqrt{4P^2 - Q^2}}$$

$$= \frac{1}{\sqrt{\frac{4P^2 - Q^2}{Q^2}}}$$

$$= \frac{1}{\sqrt{4\left(\frac{P}{Q}\right)^2 - 1}}$$

$\therefore$ For a given A , D can be expressed as a function of $\frac{k}{n}$, and $\frac{k}{n}$ can be expressed as a function of $\frac{P}{Q}$.
 $\therefore$ The total distance travelled depends only on $\frac{P}{Q}$. ✓
