$$f(x) = x^3 + 2x^2 - x + C$$

Substitute point $P(1,0)$ into $f(x)$:

$$0 = (1)^3 + 2(1)^2 - (1) + C$$

$$0 = 1 + 2 - 1 + C$$

$$C = -2$$

$$\therefore f(x) = x^3 + 2x^2 - x - 2$$

2 marks for correct solution of $f(x)$.

1 mark for substantial progress towards the correct solution.

(e)

(i)

$$x^2 = 3 - 2x$$

$$x^2 + 2x - 3 = 0$$

$$(x + 3)(x - 1) = 0$$

$$x = 3 \text{ or } x = 1$$

$$\therefore x = 1 \text{ (since, } x > 0)$$

Substitute $x = 1$ into $y = 3 - 2x$

$$y = 1$$

$$\therefore P(1,1)$$

2 marks for correct values of x and y .

1 mark for one correct value of x or y .

(ii)

From $y = 3 - 2x$, the x -intercept is $\frac{3}{2}$

Splitting the area into 3 sections, A_1 , A_2 , A_3 , where A_2 and A_3 are triangles.

$$A_1 = \int_0^1 x^2 dx$$

3 marks for correct shaded area.

2 marks for correct area of the region $y = x^2$ from $x = 0$ to $x =$

$$= \left[\frac{x^3}{3} \right]_0^1$$

$$= \frac{1}{3}$$

$$A_2 = \frac{1}{2} \times \frac{1}{2} \times 1$$

$$= \frac{1}{4}$$

$$A_3 = \frac{1}{2} \times \frac{1}{2} \times 1$$

$$= \frac{1}{4}$$

$$\therefore \text{Shaded Area} = \frac{1}{3} + \frac{1}{4} + \frac{1}{4}$$

$$= \frac{5}{6} \text{ units}^2$$

Alternate solution:

$$\text{Shaded Area} = \int_0^1 x^2 dx + \int_1^{1.5} 3 - 2x dx + \left| \int_{1.5}^2 3 - 2x dx \right|$$

$$= \frac{1}{3} + \frac{1}{4} + \frac{1}{4}$$

$$= \frac{5}{6} \text{ units}^2$$

1 and one other section or substantial progress towards the correct solution.

1 mark for correct area of only one section or some progress towards the correct solution.

Marks were not deducted this time, but may be in future tasks. You should start with one side of the statement to be proven, clearly indicating which side you have started with.	2 marks : correct solution 1 mark : substantial progress towards correct answer
