① $z^{10} = (r \cos \frac{\pi}{7})^{10}$
 $= r^{10} \cos \frac{10\pi}{7}$
 $\therefore \text{Arg}(z^{10}) = \frac{10\pi}{7} = -\frac{4\pi}{7} \therefore \text{D}$

② $b-a = \begin{pmatrix} -2m+4 \\ 4 \\ -4 \end{pmatrix}$
 $(b-a) \cdot b = 0$ for perpendicular
 $\therefore \begin{pmatrix} -2m+4 \\ 4 \\ -4 \end{pmatrix} \cdot \begin{pmatrix} -2m \\ 2 \\ 2 \end{pmatrix} = 0$
 $\therefore 4m^2 - 8m + 8 - 8 = 0$
 $4m(m-2) = 0$
 $m=0$ or $2 \therefore \text{C}$

③ Need a true integer that is not a p.f. $\square$
 but is prime $\therefore \text{A}$

④ $\dot{x} = \begin{pmatrix} 2 \\ 2t \\ 3t^2 \end{pmatrix} \ddot{x} = \begin{pmatrix} 0 \\ 2 \\ 6t \end{pmatrix}$
 At $t=1, \ddot{x} = \begin{pmatrix} 0 \\ 2 \\ 6 \end{pmatrix} \therefore \text{A}$

⑤ $\int \frac{(\sin x - \cos x)(\sin^2 x + \sin x \cos x + \cos^2 x)}{(\sin x - \cos x)} dx$
 $= \int \sin^2 x + \cos^2 x + \sin x \cos x dx$
 $= \int 1 + \frac{1}{2} \sin 2x dx$
 $= x + \frac{\sin^2 x}{2} + C \therefore \text{B}$

⑥ $\exists x \in \mathbb{R}^+, \forall y \in \mathbb{R}^+, xy \neq 1 \therefore \text{B}$
 The original statement basically says:
 'All true real x have a reciprocal
 and the reciprocal is also true real'.
 The negation therefore is:
 'There exists a true real x which does
 not have a true real reciprocal'.
 Note that the original statement is true &
 thus the negation should be false.

⑦ $x=0, u=\pi$
 $x=\pi, u=0$

$\frac{dx}{du} = -1 \therefore dx = -du$

$I = \int_{\pi}^0 (\pi-u) \sin(\pi-u) (-du)$
 $= \int_0^{\pi} (\pi-u) \sin u du = \pi \int_0^{\pi} \sin u du - \int_0^{\pi} u \sin u du$

$\therefore I = \int_0^{\pi} x \sin x = \pi \int_0^{\pi} \sin u du - \int_0^{\pi} x \sin x dx$
 via change of variable

$\therefore I = \int_0^{\pi} x \sin x = \pi \int_0^{\pi} \sin x dx - I$
 $\therefore 2I = \pi \int_0^{\pi} \sin x dx \therefore I = \frac{\pi}{2} \int_0^{\pi} \sin x dx$
 $\therefore \text{C}$

⑧ $z^3 \bar{z} = i$
 $A: e^{i\frac{3\pi}{4}} e^{-i(\frac{\pi}{4})} = e^{i\frac{2\pi}{4}} = e^{i\frac{\pi}{2}} = i \therefore \text{A}$
 $\cos \frac{\pi}{2} + i \sin \frac{\pi}{2} = i$
 [similar for B, C, D but none work]

⑨ $\sim (0 < \frac{1}{x} < \frac{1}{y}) \rightarrow \sim (x > y > 0)$

$\therefore \text{If } 0 > \frac{1}{x} \text{ or } \frac{1}{x} \geq \frac{1}{y} \text{ then}$
 $x \leq y \text{ or } y \leq 0 \therefore \text{A}$
 Note that to negate 'AND' we
 reverse inequalities and change to 'OR'.
 A Squeezed inequality is an AND situation.

(1) (a) (i) $\bar{z} = a + 2bi$

(2) $\frac{1}{\bar{z}} = \frac{1}{a+2bi} \times \frac{a-2bi}{a-2bi}$
 $= \frac{a-2bi}{a^2+4b^2} = \frac{a}{a^2+4b^2} - \frac{2b}{a^2+4b^2}i$

(ii) $z^2 = a^2 - 4abi - 4b^2$

(1) $= a^2 - 4b^2 - 4abi$

b) (i) $e^{-i\theta} = \cos(-\theta) + i\sin(-\theta)$

(1) $= \cos\theta - i\sin\theta$

(ii) Subtract vertically:
 $e^{i\theta} - e^{-i\theta} = 2i\sin\theta$

(1) $\therefore \sin\theta = \frac{e^{i\theta} - e^{-i\theta}}{2i}$

(iii) $\sin^3\theta = \frac{e^{3i\theta} - 3e^{i\theta} + 3e^{-i\theta} - e^{-3i\theta}}{8i^3}$

(2) $= \frac{e^{3i\theta} - e^{-3i\theta} - 3(e^{i\theta} - e^{-i\theta})}{-8i}$

$= \frac{2i\sin 3\theta - 3 \times 2i\sin\theta}{-8i}$

$= \frac{2\sin 3\theta - 6\sin\theta}{-8}$

$= \frac{\sin 3\theta - 3\sin\theta}{-4}$

$= \frac{3\sin\theta - \sin 3\theta}{4}$

$= \frac{3}{4}\sin\theta - \frac{\sin 3\theta}{4}$

(c) (i) $6x^2 + 3x + 17 = A(x^2 + 2x + 5) + (Bx + 1)(x - 3)$

let $x = 3$: $80 = 20A \therefore A = 4$ (2)

Coeff x^2 : $6 = 4 + B \therefore B = 2$

(ii) $\int \frac{4}{x-3} + \frac{2x+1}{x^2+2x+5} dx$ (3)

$= 4\ln|x-3| + \int \frac{2x+1}{x^2+2x+5} \cdot \frac{1}{(x+1)^2+4} dx$

$= 4\ln|x-3| + \ln|x^2+2x+5| - \frac{1}{2} \tan^{-1}\left(\frac{x+1}{2}\right) + C$

(d) let n be irrational & $\sqrt{n}$ rational
 $\therefore \sqrt{n} = \frac{a}{b}, a, b \in \mathbb{Z}^+$

$\therefore n = \frac{a^2}{b^2}$

$\therefore n$ rational
 But n irrational! $\therefore$ Contradiction
 $\therefore$ statement is true. ✓

(12) (i) amp = $\frac{10-6}{2} = 2m$

(ii) period = 7 hours
 $\therefore$ period = 14 hours

(iii) $3\frac{1}{2}$ hours is halfway between low & high tide
 $\therefore$ Centre of motion $\therefore 8m$

(iv) $y = 2\cos\left(\frac{\pi}{7}t + \alpha\right) + 8$
 Period = $14 = \frac{2\pi}{\frac{\pi}{7}} \therefore n = \frac{\pi}{7}$

$\therefore y = 2\cos\left(\frac{\pi}{7}t + \alpha\right) + 8$

$y = 2\cos\frac{\pi}{7}t \cos\alpha - 2\sin\frac{\pi}{7}t \sin\alpha + 8$

when $t = 0, y = 6$

$\therefore 6 = 2\cos\alpha + 8 \therefore \cos\alpha = -1$
 $\therefore \alpha = \pi$

$\therefore y = 2\cos\frac{\pi}{7}t \cos\pi - 2\sin\frac{\pi}{7}t \sin\pi + 8$

$y = 2\cos\frac{\pi}{7}t(-1) + 8 = 8 - 2\cos\left(\frac{\pi}{7}t\right)$

$q = 8 - 2\cos\left(\frac{\pi}{7}t\right)$

$\cos\left(\frac{\pi}{7}t\right) = -\frac{1}{2}$

$\therefore \frac{\pi}{7}t = \frac{2\pi}{3}, \frac{4\pi}{3}$

$t = \frac{14}{3}, \frac{28}{3} \therefore 4 \text{ hr } 40 \text{ min, } 9 \text{ hr } 20 \text{ min}$

$\therefore 12:40 \text{ pm} - 5:20 \text{ pm}$

12 (b)(i) since real coefficients,
zeros: $2a \pm bi$, $3a \pm 2bi$

Sum of zeros = $10 = 10a \therefore a = 1$

Prod of zeros = $1460 = (4a^2 + b^2)(9a^2 + 4b^2)$

$\therefore (4 + b^2)(9 + 4b^2) = 1460$

$4b^4 + 25b^2 + 36 = 1460$

$4b^4 + 25b^2 - 1424 = 0$

$b^2 = \frac{-25 \pm \sqrt{625 + 16 \times 1424}}{8}$

$= \frac{-25 \pm 153}{8} = \frac{128}{8} \text{ or } -\frac{178}{8}$

$= 16 \text{ or } -22\frac{1}{4}$

but b integer

$\therefore b = \pm 4$

$\therefore$ Zeros: $2 \pm 4i$, $3 \pm 8i$

(ii) $\begin{matrix} \uparrow & \uparrow \\ \text{sum} = 4 & \text{sum} = 6 \\ \text{Prod} = 4 + 16 = 20 & \text{Prod} = 9 + 64 = 73 \end{matrix}$

$\therefore (z^2 - 4z + 20)(z^2 - 6z + 73)$

(c) $3^1 > 2(1) + \frac{1}{2} \ln 1$

$3^2 > 2(2) + \frac{1}{2} \ln 2$

$3^3 > 2(3) + \frac{1}{2} \ln 3$

$\vdots$
 $3^n > 2(n) + \frac{1}{2} \ln n$

$\therefore \underbrace{3^1 + 3^2 + 3^3 + \dots + 3^n}_{\text{LHS}} > 2(1+2+3+\dots+n) + \frac{1}{2}(\ln 1 + \ln 2 + \ln 3 + \dots + \ln n)$

LHS: $a=3, r=3, n=n$

$\therefore \frac{3(3^n - 1)}{3 - 1} > 2 \frac{n(n+1)}{2} + \frac{1}{2} (\ln(1 \times 2 \times 3 \times \dots \times n))$

$\therefore \frac{3}{2}(3^n - 1) > n(n+1) + \frac{1}{2} \ln(n!)$

$3(3^n - 1) > 2n^2 + 2n + \ln(n!)$

$3^{n+1} - 3 > 2n^2 + 2n + \ln(n!)$

$\therefore 3^{n+1} > 2n^2 + 2n + 3 + \ln(n!)$

(13) (a) $n=1: u_1 = \frac{1}{3}(2^2 + (-1)^1) = \frac{1}{3}(4-1) = \frac{3}{3} = 1$

$\therefore$ True for $n=1$

$n=2: u_2 = \frac{1}{3}(2^3 + (-1)^2) = \frac{1}{3}(8+1) = \frac{9}{3} = 3$

$\& u_2 = 2u_1 + (-1)^2 = 2(1) + 1 = 3$

$\therefore$ True for $n=2$

Let $n=k$ be true integer such that

$u_k = \frac{1}{3}(2^{k+1} + (-1)^k)$

Prove $n=k+1$ is integer such that

$u_{k+1} = \frac{1}{3}(2^{k+2} + (-1)^{k+1})$

Proof: LHS = $2u_k + (-1)^{k+1}$
