Case 1 but NOT by 10

$$\therefore a = 10k-5, k \in \mathbb{Z}^+$$

$$\begin{aligned} a^2 - 5a &= (10k-5)^2 - 5(10k-5) \\ &= (10k-5)(10k-5-5) \\ &= 5(2k-1) \times 10(k-1) \\ &= 50(k-1)(2k-1) \end{aligned}$$

which is divisible by 50.

Case 2: a divisible by 10:

$$\begin{aligned} a &= 10k \\ a^2 - 5a &= (10k)^2 - 5(10k) \\ &= 100k^2 - 50k \\ &= 50k(2k-1) \end{aligned}$$

which is divisible by 50.

(b)(i) Let $\sqrt{2}$ be rational

$$\text{i.e. } \sqrt{2} = \frac{p}{q}, p, q \in \mathbb{Z}^+, p, q \text{ mutually prime.}$$

Squaring BS:

$$2 = \frac{p^2}{q^2}$$

$$2q^2 = p^2 \quad (1)$$

$\therefore$ As q NOT factor of p

$2q^2$ is a factor of p

$$p = 2k$$

$$p^2 = 4k^2 \quad (2)$$

Sub. (1) in (2):

$$2q^2 = 4k^2$$

$$q^2 = 2k^2$$

$\Rightarrow 2$ is a factor of q^2

$\therefore 2$ is a factor of q .

BUT p & q are mutually prime.

Contradiction.

$\sqrt{2}$ is IRRATIONAL.

(ii) Contrapositive.

If n is divisible by 6,
 n^2 is divisible by 18.

$$\text{Let } n = 6k$$

$$n^2 = 36k^2$$

$$= 18 \times 2k$$

which is divisible by 18.

$$(iii) \sqrt{18} = 3\sqrt{2}$$

If $\sqrt{18}$ is rational,

$$\sqrt{18} = \frac{p}{q}$$

$$\therefore \sqrt{2} = \frac{p}{3q} \text{ which is rational.}$$

But $\sqrt{2}$ is NOT rational.

$\therefore \sqrt{18}$ is irrational.
