TRIAL HIGHER SCHOOL CERTIFICATE
EXAMINATION 2017

MATHEMATICS
EXTENSION 1

General Instructions:

- Reading Time: 5 minutes.
- Working Time: 2 hours.
- Write in black or blue pen.
- Board approved calculators & templates may be used
- A Standard Integral Sheet is provided.
- In Question 11 - 14, show all relevant mathematical reasoning and/or calculations.
- Marks may not be awarded for careless or badly arranged working.

Total Marks 70

Section I: 10 marks

- Attempt Question 1 – 10.
- Answer on the Multiple Choice answer sheet provided.
- Allow about 15 minutes for this section.

Section II: 60 Marks

- Attempt Question 11 - 14
- Answer on blank paper unless otherwise instructed. Start a new page for each new question.
- Allow about 1 hours & 45 minutes for this section.

Multiple Choice Questions

Choose the best answer for each of the following questions:

1. Differentiate $\tan^2 5x$.

- A $2 \tan 5x$
- B $10 \tan 5x$
- C $10 \tan 5x \sec 5x$
- D $10 \tan 5x \sec^2 5x$

2. Evaluate $\lim_{x \rightarrow 0} \frac{\sin \frac{x}{5}}{3x}$.

- A $\frac{3}{5}$
- B $\frac{5}{3}$
- C 15
- D none of the above

3. Let each different arrangement of all the letters of the word “DELETED” be considered a word. How many words are possible altogether?

- A 420
- B 630
- C 840
- D None of the above

The answers to all questions are to be returned in separate *stapled* bundles clearly labelled Question 11, Question 12, etc. Each question must show your Candidate Number.

4. Suppose the rate of change of a quantity N is proportional to the excess of N over a fixed quantity P .

i.e. $\frac{dN}{dt} = -k(N - P)$, where k is a constant.

If t is the time and the value of A is $(N - P)$ when $t = 0$, then which of the following is true?

A $N = P - Ae^{-kt}$

B $N = P - Ae^{kt}$

C $N = P + Ae^{-kt}$

D $N = P + Ae^{kt}$

5. A particle is travelling in Simple Harmonic Motion. If x is the displacement at time t , v is the velocity and $\ddot{x}$ is the acceleration. Which of the following cannot be true?

A $x = -3 \cos 4t$

B $\ddot{x} = 4 - 4x^2$

C $\ddot{x} = 4 - 4x$

D $v^2 = 4(1 - x^2)$

6. Which expression is equal to $\int \sin^2 2x dx$?

A $\frac{-\cos^3 2x}{6} + C$

B $\frac{\sin^3 2x}{6} + C$

C $\frac{1}{2}(x - \frac{1}{4}\sin 4x) + C$

D $\frac{1}{2}(x + \frac{1}{4}\sin 4x) + C$

7. Find the equation of the chord of contact of the tangents to the parabola $x^2 = 8y$ from the point $(3, -2)$.

A $3x + 4y + 8 = 0$

B $3x - 4y + 8 = 0$

C $3x - 4y - 8 = 0$

D $3x + 4y - 8 = 0$

8. Which of the following may not be true in a circle?

i Equal arcs subtend equal chords.

ii Angles at the circumference subtended by equal chords are equal.

iii Angle at the centre is twice the angle at the circumference.

iv If a line subtends equal angles then the 4 end points are concyclic.

A ii only

B i, ii, iv only

C ii, iii, iv only

D All of i, ii, iii, iv

9. The point A is $(-2, 1)$ and the point B is $(b, -3)$. The point $P(13, -9)$ divides the interval AB externally in the ratio of 5:3. Find the value of b .

A 4

B -4

C $\frac{6}{7}$

D $-\frac{6}{7}$

10. The quadratic equation $ax^2 + bx + c = 0$ has roots $x = \tan \alpha$ and $x = \tan \beta$. Which of the following is/are true?

i $\tan(\alpha + \beta) = \frac{b}{c - a}$ ii $\tan^2(\alpha - \beta) = \frac{b^2 - 2ac}{(a + c)^2}$ iii $\tan^2(\alpha - \beta) = \frac{b^2 - 4ac}{(a + c)^2}$

A i only

B ii only

C i & ii only

D i & iii only

Question 11	Marks	Question 12 (15 marks) (START A NEW PAGE)	
a) Find $\int \frac{5}{4+8x^2} dx$.	2	a) Consider $f(x) = e^x - e^{-x}$.	
b) Find $\int \frac{x^3}{\sqrt{x^2+1}} dx$ (use substitution $u = \sqrt{x^2+1}$).	3	(i) Justify that the inverse of $f(x)$ exists.	1
c) (i) A particle is travelling in a straight line. Its displacement from the origin is x m/s at time t seconds.	2	(ii) Find the equation of $f^{-1}(x)$.	3
If $x = \sqrt{3} \cos 2t - \sin 2t$, express x in the form of $R \cos(2t + \alpha)$, where $R > 0$ and $0 \leq \alpha \leq 2\pi$.		b) Find the coefficient of x^4 in the expansion of $(2 - 5x)^7$.	2
(ii) Find the maximum speed of the particle and the time when it first occurs.	2	c) (i) A fair coin is tossed $2n$ times. Write down the probability (P_k) of observing k heads and $(2n - k)$ tails.	1
d) Find the area of the region bounded by the curve $y = \frac{x}{\sqrt{x^2-1}}$, the x -axis and the lines $x = \sqrt{10}$, $x = \sqrt{5}$.	3	(ii) Find the probability of the most likely outcome and simplify it. Give reason(s).	2
e) (i) Given the equation $x - 2 \sin x = 0$.	1	d) (i) Find the derivative of $y = \sin^{-1}[2x(1-x)]$.	1
Show that there is at least one root between $x = 1.5$ and $x = 2$.		(ii) Hence find the maximum value of $y = \sin^{-1}[2x(1-x)]$.	2
(ii) Use Newton's method to find a second approximation to the positive root of $x - 2 \sin x = 0$.	2	(iii) Sketch the graph of $y = \sin^{-1}[2x(1-x)]$.	3
Take $x = 1.7$ as the first approximation.			

Question 13 (15 marks) (START A NEW PAGE)

a)

At a certain instant, a plane flies overhead at a constant altitude of 5000 metres and at a constant speed of 100 metres per second.

When the plane has travelled x metres from the overhead position, its angle of elevation from the observer is θ radians.

- (i) Show that $\frac{dx}{d\theta} = -\frac{5000}{\sin^2 \theta}$. 2
- (ii) Hence show that $\frac{d\theta}{dt} = -\frac{1}{50} \sin^2 \theta$. 1
- (iii) Find the rate at which the angle of elevation is changing 50 seconds after the plane is overhead. 2

Question 13 continues on the next page

Question 13 (continued)

- b) There are four couples: Katie and Ming, David and Betty, Margaret and Danny, May and Kent. They go to a cinema and decide to sit in the last row. 2
 How many different arrangements are possible if Katie and Ming want to sit together but May and Kent do not want to sit together?
- c) (i) The acceleration ($\ddot{x}$) of a particle at a displacement from the origin (x) is given by $\ddot{x} = \frac{1}{x}$. 2
 Initially the particle is at rest at a point 25m from the origin, find its velocity (v) in terms of x .
 (ii) Briefly describe its motion. 1
- d) (i) Prove $(x+y) \geq 2\sqrt{xy}$, $x > 0, y > 0$. 2
 (ii) Hence or otherwise, find the largest possible value for $\log_a\left(\frac{\alpha}{\beta}\right) + \log_\beta\left(\frac{\beta}{\alpha}\right)$, $\alpha, \beta > 1$ 3

Question 14 (15 marks) (START A NEW PAGE)

a) Prove by Mathematical induction that $3^n > n^3$ for $n \geq 4$.

4

b) The diagram below shows a plane P which is flying at a constant speed of $\sqrt{8gh}$ m/s upwards at an angle of elevation 30° .

At the instant when the plane is at a height h metres vertically above a missile silo, which is located at a point O on the ground, a cruise missile from the silo is launched at an angle of elevation α to hit the plane where $0^\circ \leq \alpha \leq 90^\circ$.

The launching speed of the missile is u m/s, t is the time in seconds after launch and g is the acceleration due to gravity in m/s^2 .

With the axes shown in the diagram above, you may assume the following equations:
(DO NOT PROVE)

Position of the missile is given by $x = ut \cos \alpha$, $y = ut \sin \alpha - \frac{1}{2}gt^2$

The trajectory of the missile is given by $y = x \tan \alpha - \frac{gx^2}{2u^2}(1 + \tan^2 \alpha)$

(i) Show that the trajectory of the plane is given by $y = \frac{x}{\sqrt{3}} + h$. 1

(ii) Show that $u \cos \alpha = \sqrt{6gh}$. 2

(iii) Assuming the missile can hit the plane, hence, from part (i), show that the x -coordinates of the plane of collision must satisfy $\frac{x^2}{12} + \left(-\frac{1}{\sqrt{3}} - \tan \alpha\right)hx + h^2 = 0$. 3

Question 14 (continued)

(iv) Suppose that $\tan \alpha > \frac{2}{\sqrt{3}}$.

(α) Show that there are two possible points of collision, at B and C , between the plane and the missile. 2

(β) Show that the time T (in seconds) elapsed between the two points of collision is given by : 3

$$T = \sqrt{\frac{8h \tan \alpha}{g} (3 \tan \alpha - 2\sqrt{3})}.$$

Section I Multiple Choice 10 Marks

Attempt Question 1 – 10 (1 mark each)
Allow approximately 15 minutes for this section.

Use the multiple choice answer sheet below to record your answers to Question 1 – 10.

Select the alternative: A, B, C or D that best answers the question.

Colour in the response oval completely.

Sample:

2 + 4 = ? (A) 2 (B) 6 (C) 8 (D) 9

A ☐ B ☒ C ☐ D ☐

If you think you have made a mistake, draw a cross through the incorrect answer and colour in the new answer

ie A ☒ B ☒ C ☐ D ☐

If you change your mind and have crossed out what you consider to be the correct answer, then indicate this by writing the word "correct" and draw an arrow as follows:

A ☒ B ☒ C ☐ D ☐
correct

Trial HSC Examination 2017

MATHEMATICS Extension 1 : Question 13. $\frac{1}{3}$		Marks	Marker's Comments
Suggested Solutions			
(a) (i)  alternate angles on // lines are equal. $\tan \theta = \frac{5000}{x}$ $x = \frac{5000}{\tan \theta}$ $x = 5000 \cot \theta$ $\frac{dx}{d\theta} = 5000(-\cot^2 \theta)$ $= -5000 \frac{1}{\sin^2 \theta}$			① needed a line or two of working to get the second mark.
(ii) $\frac{dx}{dt} = 100$ $\frac{d\theta}{dt} = \frac{d\theta}{dx} \times \frac{dx}{dt}$ $= -\frac{\sin^2 \theta}{5000} \times 100$ $= -\frac{\sin^2 \theta}{50}$			①
(iii) $t = 50$ $x = 100t$ $\tan \theta = \frac{5000}{5000}$ $\tan \theta = 1$ $\theta = \frac{\pi}{4}$ $\frac{d\theta}{dt} = -\frac{\sin^2 \theta}{50} = -\frac{\sin^2(\frac{\pi}{4})}{50} = -\frac{1}{50}$ $\frac{d\theta}{dt} = -\frac{1}{100} \text{ rad/sec}$			①
(b) 5! ways of arranging Kate, Ming, P, B, M, D 2! internal arrangements of Kate + Ming (KM) (D) (B) (M) (D) 6! places for Ming 5! places for Kate Total = $5! \times 2 \times 6 \times 5 = 7200$ or All arrangements with Ming + Kate together ... all arrangements with Ming + Kate + P + B + M + D together $7! \times 2! - 6! \times 2! = 10080 - 2880 = 7200$			① ①

(c)(i) $V \frac{dv}{dx} = \frac{1}{x}$
 $\int v dv = \int \frac{dx}{x}$
 $\frac{1}{2} v^2 = \ln x + C$

when $t=0, v=0, x=25$

$0 = \ln 25 + C$
 $C = -\ln 25$

$\therefore \frac{1}{2} v^2 = \ln x - \ln 25$

$\frac{1}{2} v^2 = \ln \frac{x}{25}$

$v^2 = 2 \ln \frac{x}{25}$

$v = \pm \sqrt{2 \ln \frac{x}{25}}$

now initially $x = 25$, so particle moves to the right. velocity is only zero when $x = 25$, so particle won't change direction i.e. keeps moving right.

$\therefore v = \sqrt{2 \ln \frac{x}{25}}$ only

(ii) Initially the particle is at rest at 25m to the right of the origin. The acceleration is positive so it moves to the right. It continues to move to the right with increasing speed at a decreasing acceleration, never stops and never changes direction.

(d)(i) consider $(x-y)^2 \geq 0$
 $x^2 + y^2 - 2xy \geq 0$ $x > 0, y > 0$

$x^2 + y^2 \geq 2xy$

$x^2 + y^2 + 2xy \geq 4xy$

$(x+y)^2 \geq 4xy$

$x+y \geq 2\sqrt{xy}$

①

①

MUST USE WORDS

①

①

①

or $(\sqrt{x} - \sqrt{y})^2 \geq 0$ $x > 0, y > 0$ ①
 $x - 2\sqrt{xy} + y \geq 0$
 $x + y \geq 2\sqrt{xy}$ ①

(ii) $\log_x \left(\frac{x}{\beta} \right) + \log_\beta \left(\frac{\beta}{x} \right) = \log_x x - \log_x \beta + \log_\beta \beta - \log_\beta x$
 $= 1 - \log_x \beta + 1 - \log_\beta x$
 $= 2 - \log_x \beta - \log_\beta x$ ①

now $\log_\beta x + \log_x \beta \geq 2 \sqrt{\log_\beta x \log_x \beta}$
 $\geq 2 \sqrt{\frac{\log_\beta x}{\log_\beta x} \cdot \frac{\log_x \beta}{\log_x \beta}}$
 $\geq 2 \sqrt{1 \cdot 1}$
 ≥ 2

so $-\log_\beta x - \log_x \beta \leq -2$ ①

$\therefore \log_x \left(\frac{x}{\beta} \right) + \log_\beta \left(\frac{\beta}{x} \right) \leq 2 - 2$

$\log_x \left(\frac{x}{\beta} \right) + \log_\beta \left(\frac{\beta}{x} \right) \leq 0$

$\therefore$ max. value is zero ①

* If you let $x = \log_x \left(\frac{x}{\beta} \right)$ and $y = \log_\beta \left(\frac{\beta}{x} \right) \Rightarrow$ maximum of one mark if the algebra is correct.

* Some students proved it was a maximum but wrote a max value of 0 without an explanation $\Rightarrow$ 2 marks only.

Marker's Comments

$$a) 3^n > n^3, n \geq 4$$

 For $n=4$,

$$3^4 = 81$$

$$4^3 = 64$$

$$\therefore 3^4 > 4^3$$

 $\therefore$ true for $n=4$

 Assume true for $n=k$,

$$\text{ie } 3^k > k^3 \text{ for } k \geq 4$$

 Prove true for $n=k+1$

$$\text{ie } 3^{k+1} > (k+1)^3$$

$$\text{LHS} = 3^{k+1}$$

$$= 3 \times 3^k$$

$$= 3^k + 3^k + 3^k$$

$$> k^3 + k^3 + k^3 \text{ (by assumption)}$$

$$\geq k^3 + 4k^2 + 4k^2 \text{ (} k \geq 4 \text{)}$$

$$= k^3 + 3k^2 + 3k^2 + 2k^2$$

$$> k^3 + 3k^2 + 3k + 2 \text{ (since } k \geq 4 \text{)}$$

$$> k^3 + 3k^2 + 3k + 1$$

$$= (k+1)^3$$

$$\therefore 3^{k+1} > (k+1)^3$$

 $\therefore$ the statement is true by the principle of mathematical induction

$$\text{OR } 3^k - k^3 > 0$$

$$\text{RTP: } 3^{k+1} - (k+1)^3 > 0$$

$$\text{LHS} = 3^k \times 3 - k^3 - 3k^2 - 3k - 1$$

$$= 3(3^k - k^3) + 2k^3 - 3k^2 - 3k - 1$$

$$\text{from assumption: } 3^k - k^3 > 0$$

$$\therefore 3(3^k - k^3) > 0$$

$$\therefore \text{RTP: } 2k^3 - 3k^2 - 3k - 1 > 0$$

$$\text{for } k \geq 4$$

1

2 for working out and conclusion.

$$\text{let } f(k) = 2k^3 - 3k^2 - 3k - 1$$

$$f'(k) = 6k^2 - 6k - 3$$

$$\text{when } f'(x) = 0$$

$$k = \frac{6 \pm \sqrt{36 + 4(6)(3)}}{2(6)}$$

$$= \frac{6 \pm \sqrt{108}}{12}$$

$$= \frac{1 \pm \sqrt{3}}{2}$$

$$\text{for } k = \frac{1+\sqrt{3}}{2}$$

k	1	$\frac{1+\sqrt{3}}{2}$	2
f(k)-3	0	0	9

$$4 > \frac{1+\sqrt{3}}{2}$$

$$\therefore f'(k) > 0 \text{ for } k \geq 4$$

$$f(4) = 2(4)^3 - 3(4)^2 - 3(4) - 1$$

$$= 67 > 0$$

$$\text{since } f(4) > 0 \text{ and } f'(k) > 0$$

$$\text{for } k \geq 4,$$

$$2k^3 - 3k^2 - 3k - 1 > 0 \text{ for } k \geq 4$$

$$\therefore 3^{k+1} - (k+1)^3 > 0$$

 $\therefore$ statement is true by the process of mathematical induction

$$b) i) y = mx + b$$

$$\text{where } b = h$$

$$\text{and } m = \tan 30$$

$$= \frac{1}{\sqrt{3}}$$

$$\therefore y = \frac{x}{\sqrt{3}} + h$$

$$ii)$$

$$\cos 30 = \frac{x}{\sqrt{3}gh}$$

$$\therefore x = \sqrt{3}gh \cos 30$$

Marker's Comments

the missile will hit the plane at time t when:

$$x_{\text{missile}} = x_{\text{plane}}$$

$$u \cos \alpha = \frac{1}{\sqrt{3}} \sqrt{gh} \cos 30^\circ$$

$$u \cos \alpha = \sqrt{gh} \times \frac{\sqrt{3}}{2}$$

$$u \cos \alpha = \sqrt{\frac{8 \times 3}{4} gh}$$

$$\therefore u \cos \alpha = \sqrt{6gh}$$

iii) $y = \frac{x}{\sqrt{3}} + h$ from (i)

$$y = x \tan \alpha - \frac{gx^2}{2u^2} (1 + \tan^2 \alpha) \text{ (given)}$$

when they collide:

$$\frac{x}{\sqrt{3}} + h = x \tan \alpha - \frac{gx^2}{2u^2} (1 + \tan^2 \alpha)$$

$$\frac{x}{\sqrt{3}} + h - x \tan \alpha + \frac{gx^2}{2u^2} (\sec^2 \alpha) = 0$$

$$\frac{x}{\sqrt{3}} + h - x \tan \alpha + \frac{gx^2}{2u^2 \cos^2 \alpha} = 0$$

$$\frac{gx^2}{2(6gh)} + x \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) + h = 0$$

since $u^2 \cos^2 \alpha = (\sqrt{6gh})^2$ from (i)

$$\frac{x^2}{12h} + x \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) + h = 0$$

$$\therefore \frac{x^2}{12} + xh \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) + h^2 = 0$$

iv) Δ from equation of (iii)

$$\Delta = h^2 \left(\frac{1}{\sqrt{3}} - \tan \alpha \right)^2 - 4 \left(\frac{1}{12} \right) h^2$$

$$= h^2 \left(\frac{1}{3} - \frac{2}{\sqrt{3}} \tan \alpha + \tan^2 \alpha \right) - \frac{h^2}{3}$$

$$= h^2 \left(\tan^2 \alpha - \frac{2}{\sqrt{3}} \tan \alpha \right)$$

$$= h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)$$

Suggested Solutions

Marks

Marker's Comments

since $\tan \alpha > \frac{2}{\sqrt{3}}$

$$\tan \alpha - \frac{2}{\sqrt{3}} > 0 \text{ and } h^2 > 0$$

$$\therefore h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right) > 0$$

$$\therefore \Delta > 0$$

$\therefore$ the equation has 2 distinct real roots at B and C.

β) from equation in (iii)

$$x = \frac{-h \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) \pm \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)}}{2 \times \frac{1}{12}}$$

$$x = -6h \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) \pm 6 \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)}$$

$$x_1 - x_2 = -6h \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) + 6 \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)} - \left(-6h \left(\frac{1}{\sqrt{3}} - \tan \alpha \right) - 6 \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)} \right)$$

$$= 12 \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)}$$

$$\text{time} = \frac{\text{distance}}{\text{speed}}$$

$$T = \frac{12 \sqrt{h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)}}{u \cos \alpha}$$

$$= \frac{\sqrt{144 h^2 \tan \alpha \left(\tan \alpha - \frac{2}{\sqrt{3}} \right)}}{\sqrt{6gh}}$$

$$= \sqrt{\frac{24 h \tan \alpha \left(\tan \alpha - \frac{2\sqrt{3}}{3} \right)}{g}}$$

$$= \sqrt{\frac{\frac{24}{3} \times h \tan \alpha (3 \tan \alpha - 2\sqrt{3})}{g}}$$

$$\therefore T = \sqrt{\frac{8 h \tan \alpha (3 \tan \alpha - 2\sqrt{3})}{g}}$$

must have clear explanation of why $\Delta > 0$ cannot just substitute $\tan \alpha = \frac{2}{\sqrt{3}}$ and $\therefore \Delta > 0$

$\Rightarrow$ working out.
