All displacements are in metres.

At one stage during the game, the jack is at the point $J(1, 33)$.

End of Question 13

Question 14 (15 marks) Use a SEPARATE writing booklet.

A ‘parasailing’ water-skier i.e. a water-skier with a parachute attached of mass 90 kg is towed by a boat in a straight line from rest.

The boat exerts a constant force of 410 N acting horizontally on the skier.

At this stage the resistance acting on the skier is a constant 50 N, which acts horizontally.

- (a) By use of a force diagram, show that the acceleration of the skier is 4 m/s^2 . 2
- (b) By starting with $a = 4$, show that the speed of the skier, is given by $v^2 = 8x$, where x is the horizontal distance travelled by the skier. 2
Hence show that having been towed a distance of 32 m, his speed is 16 m/s.

After the skier has been towed 32 m across the water the drag of the parachute becomes significant. The drag of the parachute produces an *additional* resistance of $6v \text{ N}$ to the horizontal motion of the skier, where $v \text{ m/s}$ is the velocity of the skier. Let $a \text{ m/s}^2$ is the acceleration of the skier.

- (c) Show that $a = \frac{1}{15}(60 - v)$ 1
- (d) Find the time required to reach a speed of 20 m/s from a speed of 16 m/s. 3
Give your answer in seconds, correct to one decimal place.

After some time, the parasailing skier is being towed horizontally at a *constant speed* and at a fixed distance above the water.

The tow rope from the boat makes an angle of 30° to the horizontal, and the parachute cord makes an angle of θ to the horizontal.

The diagram below shows all the forces that are now acting on the parasailing water skier:

The tow rope now exerts a force, T_1 , of 500 N on the skier.

The skier is experiencing a horizontal resistance, R , of 100 N.

Let the tension exerted by the parachute cord on the skier be T_2 ,

and the force due to gravity on the skier be W .

Take $g = 10$, where g is the magnitude of the acceleration due to gravity.

- (e) By resolving in the horizontal and vertical directions, show that 3
- $$\begin{cases} 500 \cos 30^\circ - T_2 \cos \theta - 100 = 0 \\ T_2 \sin \theta - 500 \sin 30^\circ - 90g = 0 \end{cases}$$

13. (a) Prove $n^{n+1} > n(n+1)^{n-1}$ for $n \geq 2$.

Let $n=2$ LHS = $2^3 = 8$ RHS = $2(3)^1 = 6$
 $\therefore$ true for $n=2$.

Assume true for $n=k$

$$k^{k+1} > k(k+1)^{k-1}$$

or $k^k > (k+1)^{k-1}$ *

or $\frac{k^k}{(k+1)^{k-1}} > 1$.

Let $n=k+1$ RTP $(k+1)^{k+1} > (k+2)^k$

OR $\frac{(k+1)^{k+1}}{(k+2)^k} > 1$

Now LHS = $\frac{(k+1)^{k+1}}{(k+2)^k}$

$$> \frac{(k+1)^{k+1}}{(k+2)^k} \times \frac{(k+1)^{k-1}}{k^k}$$

since $\frac{(k+1)^{k-1}}{k^k} < 1$
 from assumption.

$$> \frac{(k+1)^{2k}}{[k(k+2)]^k}$$

$$= \frac{[(k+1)^2]^k}{[k(k+2)]^k}$$

$$= \left[\frac{k^2 + 2k + 1}{k^2 + 2k} \right]^k > 1 \quad \#$$

$\therefore$ true for $n=k+1$.

$\therefore$ By P.O.M.I, true $\forall n \geq 2$.

$$\begin{aligned} \text{Net force} &= B - R \\ &= 410 - 50 \\ &= 360 \text{ N} \end{aligned}$$

$$F = ma$$

$$\therefore 360 = 90a$$

$$a = 4 \text{ m/s}^2 \quad [2]$$

(b) Given $a = 4$

$$\therefore \frac{d}{dx} \left(\frac{1}{2} v^2 \right) = 4$$

Integrate w.r.t. x :

$$\frac{1}{2} v^2 = 4x + C$$

$$v^2 = 8x + C'$$

Let $x = 0$ when $t = 0, v = 0$

$$\therefore C' = 0$$

$$\therefore v^2 = 8x$$

When $x = 32$

$$\begin{aligned} v^2 &= 8 \times 32 \\ &= 256 \end{aligned}$$

$$\therefore v = 16 \text{ m/s } (v > 0)$$
