$$\begin{aligned} \text{RHS} &= (1+1)! - 1 \\ &= 2 - 1 \\ &= 1 \end{aligned}$$

$$\therefore \text{LHS} = \text{RHS}$$

$\therefore$ The statement is true for $n=1$

(1)

Assume the statement is true for $n=k$, $k \in \mathbb{Z}^+$

$$\therefore 1(1!) + 2(2!) + \dots + k(k!) = (k+1)! - 1$$

Test for $n=k+1$,

$$\text{RTP: } 1(1!) + 2(2!) + 3(3!) + \dots + (k+1)[(k+1)!] = (k+2)! - 1$$

$$\text{LHS} = [1(1!) + 2(2!) + 3(3!) + \dots + k(k!)] + (k+1)[(k+1)!]$$

$$= [(k+1)! - 1] + (k+1)[(k+1)!] \quad (\text{By assumption})$$

$$= (k+1)! [1 + (k+1)] - 1$$

$$= (k+1)! (k+2) - 1$$

$$= (k+2)!$$

$\therefore$ If the statement is true for $n=k$, it is true for $n=k+1$

$\therefore$ The statement is true for all positive integer n by the principle of mathematical induction.

a) i) <u>Correct Method</u> $16x^5 - 20x^3 + 5x - 1 = 0$ Let $x = \sin\theta$ $\therefore 16\sin^5\theta - 20\sin^3\theta + 5\sin\theta - 1 = 0$ $\therefore \sin 5\theta - 1 = 0 \quad (\text{given } \sin 5\theta = 16\sin^5\theta - 20\sin^3\theta + 5\sin\theta)$ $\therefore \sin 5\theta = 1$ $5\theta = \frac{\pi}{2} + 2k\pi \quad (k \in \mathbb{N})$ $\theta = \frac{\pi}{10} + \frac{2}{5}k\pi$ When $k = 0$, $\theta = \frac{\pi}{10}$ $\therefore x = \sin \frac{\pi}{10} \text{ is one of the solutions}$ <u>Incomplete Method</u> When $x = \sin \frac{\pi}{10}$ $16x^5 - 20x^3 + 5x - 1$ $= 16\sin^5 \frac{\pi}{10} - 20\sin^3 \frac{\pi}{10} + 5\sin \frac{\pi}{10} - 1$ $= \sin(5 \times \frac{\pi}{10}) - 1 \quad (\text{given } \sin 5\theta = 16\sin^5\theta - 20\sin^3\theta + 5\sin\theta)$ $= \sin \frac{\pi}{2} - 1 = 0$	Total=2 1 1	The question asks to prove that $x = \sin \frac{\pi}{10}$ is one of the solutions. It means: ① $x = \sin \frac{\pi}{10}$ is a solution ② there are more than one solution Many students forget to add $2k\pi$ to the solution, which means they fail to prove ②. Thus, they lose 1 mark. This method can only receive up to 1 mark because it fails to prove ②.

a) ii) Method 2 - inspection By inspection, $P(x) = 16x^4 + 16x^3 - 4x^2 - 4x + 1$	2	Potential Mark: If "By inspection" or a similar statement is missing but the $P(x)$ expression is correct — 1 mark - Any answer without showing working out or mentioning "inspection method" but has the correct expression only receives 1 mark.
Method 3 - factor theorem From (i), the roots of the equation are $x = \sin \frac{\pi}{10}, \sin \frac{5\pi}{10}, \sin \frac{9\pi}{10}, \sin \frac{13\pi}{10}, \sin \frac{17\pi}{10}$ $\therefore 16x^5 - 20x^3 + 5x - 1$ $= 16(x - \sin \frac{\pi}{10})(x - \sin \frac{5\pi}{10})(x - \sin \frac{9\pi}{10})(x - \sin \frac{13\pi}{10})(x - \sin \frac{17\pi}{10})$ $= 16(x - \sin \frac{\pi}{10})(x - 1)(x - \sin \frac{9\pi}{10})(x - \sin \frac{13\pi}{10})(x - \sin \frac{17\pi}{10})$ $P(x) = 16(x - \sin \frac{\pi}{10})(x - \sin \frac{9\pi}{10})(x - \sin \frac{13\pi}{10})(x - \sin \frac{17\pi}{10})$	1	A few students use this method. Some forget to include the leading coefficient 16 in the factor form, thus receive 0 mark. In order to receive 2 marks for this method, the final answer needs to be in expanded form.

a) iii) $P(x) = (4x + ax - 1)^2$ $= 16x^4 + 16x^3 - 4x^2 - 4x + 1$ $(4x^2 + ax + 1)^2$ $= 16x^4 + 4ax^3 - 4x^2 + 4ax^3 + a^2x^2 - ax - 4x^2 - ax + 1$ Method 1: equate the coefficients x term $= -ax - ax = -2ax = -4x$ $a = 2$ Method 2: equate the coefficients x^3 term $= 4ax^3 + 4ax^3 = 8ax^3 = 16x^3$ $a = 2$	Total = 1	Note: the x or x^3 term has the simplest expression of a. It is a linear expression which avoid bringing additional solution like quadratic term does. x^2 term: $-4x^2 + a^2x^2 - 4x^2 = -4x^2$ $a^2 = 4$ $a = \pm 2$ Some students use the substitution method by subbing different values of x into the equation. Because $(4x^2 + ax - 1)^2$ has a square sign for the expression of a, it brings in an additional answer.

a) iv) $P(x) = 16x^5 - 20x^3 + 5x - 1$ $= (x-1)(4x^2 + 2x - 1)^2 = 0$ $\therefore x-1=0$ or $4x^2 + 2x - 1 = 0$ $x=1 \quad \text{or} \quad x = \frac{-2 \pm \sqrt{2^2 + 4 \times 4}}{8}$ $= \frac{-2 \pm \sqrt{20}}{8}$ $= \frac{-2 \pm 2\sqrt{5}}{8}$ $= \frac{-1 \pm \sqrt{5}}{4}$ $\therefore \sin \frac{7}{10} > 0$ $\therefore \sin \frac{7}{10} = \frac{1 + \sqrt{5}}{4}$	Total=1 1	Most students do well in this question.
