Question 14 (continued)

 Coordinates of R is $(4ap, 4ap^2)$

(c) (i) The projectile passes through the points (c, h) and (d, h)

$$h = x \tan \alpha - \frac{gx^2 \sec^2 \alpha}{2v^2}$$

$$\frac{gx^2 \sec^2 \alpha}{2v^2} - x \tan \alpha + h = 0$$

Therefore $x = c$ and $x = d$ are the roots of the quadratic equation.

(ii) Sum of the roots

$$\begin{aligned}
 c + d &= -(-\tan \alpha) \div \frac{g \sec^2 \alpha}{2v^2} \\
 &= \tan \alpha \times \frac{2v^2}{g \sec^2 \alpha} = \frac{2v^2 \tan \alpha}{g \sec^2 \alpha}
 \end{aligned}$$

(iii) Product of roots

$$cd = h \div \frac{g \sec^2 \alpha}{2v^2} = \frac{2v^2 h}{g \sec^2 \alpha}$$

Therefore using the result from (ii)

$$\begin{aligned}
 \frac{c+d}{cd} &= \frac{2v^2 \tan \alpha}{g \sec^2 \alpha} \div \frac{2v^2 h}{g \sec^2 \alpha} \\
 &= \frac{\cancel{2v^2} \tan \alpha}{g \cancel{\sec^2 \alpha}} \times \frac{g \cancel{\sec^2 \alpha}}{\cancel{2v^2} h} = \frac{\tan \alpha}{h}
 \end{aligned}$$

$$\therefore \tan \alpha = \frac{h(c+d)}{cd}$$

(iv) Rearranging $R = \frac{v^2 \sin 2\alpha}{g}$

$$\begin{aligned}
 v^2 &= \frac{Rg}{\sin 2\alpha} \\
 &= \frac{Rg}{2t} \quad (\text{where } t = \tan \alpha) \\
 &= \frac{Rg}{1+t^2} \\
 &= \frac{Rg}{2t} (1+t^2) \\
 &= \frac{Rg}{2} \left(\frac{1}{t} + t \right) \\
 &= \frac{Rg}{2} \left(\frac{cd}{h(c+d)} + \frac{h(c+d)}{cd} \right) \\
 &= \frac{Rg}{2} \left(\frac{cd}{hR} + \frac{hR}{cd} \right) \\
 &= \frac{\cancel{R}g}{2} \left(\frac{c^2 d^2 + h^2 R^2}{h \cancel{R} cd} \right) \\
 \frac{v^2}{g} &= \frac{c^2 d^2 + h^2 R^2}{2hcd}
 \end{aligned}$$
