Question 41

Most stars have at least some variation in luminosity, but unless the fluctuation is large enough to be seen from Earth, the star isn't classified as variable.

The changes in brightness of variable stars aren't generally noticeable to the unaided eye, even if the brightness does change over short timescales. To observe most variable stars, you need to monitor the brightness of the star carefully over extended periods of time.

But there are examples of stars whose brightness has noticeably faded, over short timescales.

One famous example is the red super giant star Betelgeuse.

Its brightness fluctuates over time, following the equation $y = 2 + 3 \sin\left(\frac{\pi x}{3}\right)$ where y is the magnitude of the brightness and x is the number of days.

- a) Sketch the graph of $y = 2 + 3 \sin\left(\frac{\pi x}{3}\right)$, for $0 \leq x \leq 4\pi$ on the grid given below. 2
Show all x and y intercepts.

- b) Hence or otherwise calculate how many days it takes for the star to go from its dimmest to 1
brightest and back to dimmest again.

Answer: D

Amplitude: 5

Period: For $y = 5\cos x$ distance from a maximum value at (0,5) to the next maximum value

$(2\pi, 5)$ is 2π units.

For the curve in question distance between maximum and

minimum $\frac{3\pi}{4} - \frac{\pi}{4} = \frac{\pi}{2}$

i.e Period in this situation is $= 2 \times \frac{\pi}{2} = \pi$ units

$\therefore y = 5\cos(2x)$

Phase shift: the maximum value is shifted from (0,5) to $(\frac{\pi}{4}, 5)$

$$\therefore y = 5 \cos \left(2 \left(x - \frac{\pi}{4} \right) \right) = 5 \cos \left(2x - \frac{\pi}{2} \right)$$

Question 23

a)

AVERAGE VELOCITY

Suppose that a particle has displacement $x = x_1$ at time $t = t_1$, and displacement $x = x_2$ at time $t = t_2$. Then

$$\text{average velocity} = \frac{\text{change in displacement}}{\text{change in time}} = \frac{x_2 - x_1}{t_2 - t_1}.$$

That is, on the displacement–time graph,

average velocity = gradient of the chord.

Question 34

a)

$$P(X < 0.7) = \frac{1}{3} (0.7)^2 (4 - (0.7)^2) = 0.5733$$

$$\therefore P(X > 0.7) = 1 - P(X < 0.7) = 0.4267$$

b)

$$F(x) = \frac{4}{3}x^2 - \frac{1}{3}x^4$$

1 Mark for correctly differentiating $F(x)$

c)

$$f(x) = \frac{8}{3}x - \frac{4}{3}x^3$$

$$f'(x) = \frac{8}{3} - 4x^2$$

2 Marks for complete correct solution

Mode is when $f'(x) = 0$

$$\frac{8}{3} - 4x^2 = 0$$

$$\frac{8}{3} = 4x^2$$

$$x = \pm \sqrt{\frac{2}{3}}$$

Question 37

a)

Gaming has a higher mean and smaller standard deviation meaning scores are grouped closer around the mean.

Calligraphy has a lower mean and a larger standard deviation meaning scores are spread out around the mean, less consistent marks.

b) Calligraphy z-score = $\frac{65-54}{5.6} = 1.96$

Gaming z-score = $\frac{80-76}{2.1} = 1.90$

Therefore Ricky performed better in Calligraphy as his z-score was higher.

2 marks for comparing both classes marks mean and standard dev
1 mark for comparing mean or standard deviations for both classes

1 mark for both correct z-scores
1 mark for which class he did better and why
