Answers to Multiple Choice questions

Question 1:

$$y = 5\cos^{-1}(4x)$$

$$-1 \leq 4x \leq 1$$

$$-\frac{1}{4} \leq x \leq \frac{1}{4}$$

$\therefore$ Answer C

Question 2:

The term that contains x^4 in the expansion of $(x - \sqrt{2})^6$ is $6C_4 x^4 (-\sqrt{2})^2$

$$\text{Coefficient of } x^4 = 6C_4 (-\sqrt{2})^2 = 15 \times 2 = 30$$

$\therefore$ Answer B

Question 3:

Since the zeroes of $P(x)$ are α and $\alpha + 1$

$$\text{Sum of roots: } \alpha + \alpha + 1 = -\frac{b}{1} \quad \text{Product of roots}$$

$$2\alpha + 1 = -b \quad \alpha \times (\alpha + 1) = \frac{c}{1}$$

$$\therefore b = -(2\alpha + 1) \quad \therefore c = \alpha^2 + \alpha$$

$\therefore$ Answer A

Question 4:

Upon differentiating

$$P = 10000 - 2000e^{-0.1t}$$

$$\frac{dP}{dt} = 200e^{-0.1t}$$

$$= \frac{1}{10}(2000e^{-0.1t})$$

$$\text{but, } 2000e^{-0.1t} = 10000 - P$$

$$\begin{aligned} \therefore \frac{dP}{dt} &= \frac{1}{10}(10000 - P) \\ &= -\frac{1}{10}(P - 10000), \text{ the required differential equation} \end{aligned}$$

$\therefore$ Answer C

Question 5:

$$R = \sqrt{1^2 + (\sqrt{3})^2} = 2$$

$$\tan \alpha = \frac{\sqrt{3}}{1}, \quad \alpha = \tan^{-1}(\sqrt{3}) = \frac{\pi}{3}$$

$$\therefore \sin x + \sqrt{3} \cos x = 2 \sin\left(x + \frac{\pi}{3}\right)$$

$\therefore$ Answer B

Question 6:

Diagonals of a parallelogram bisect each other. $\therefore \overline{OC} = \frac{1}{2} \overline{AC}$

$\therefore$ Answer B

Question 7:

$$\begin{aligned} y &= \sin^{-1} \frac{a}{x} \\ \frac{dy}{dx} &= \frac{1}{\sqrt{1 - \left(\frac{a}{x}\right)^2}} \times -\frac{a}{x^2} \\ &= \frac{-a}{x\sqrt{x^2 - a^2}} \end{aligned}$$

$\therefore$ Answer D

Question 8:

The differential equation $xy' - y = 0$ can be rearranged to give $y' = \frac{y}{x}$.

When $x > 0$ and $y > 0$, $y' > 0$. This rules out option C as gradients are negative in the first quadrant.

Also, when $x < 0$ and $y < 0$, $y' > 0$. This rules out A as gradients are negative in the third quadrant.

Lastly, when $x = 0$, gradients will be undefined. This leaves D as the correct answer as tangents are vertical when $x = 0$ and B has horizontal tangents when $x = 0$.

$\therefore$ Answer D

Question 9:

From reference sheet using $\sin A \sin B = \frac{1}{2} [\cos(A - B) - \cos(A + B)]$

$\sin 3x \sin 4y = \frac{1}{2} [\cos(3x - 4y) - \cos(3x + 4y)]$ is a true statement

$\therefore$ **Answer A**

Question 10:

All 4 responses feature the same vector $\mathbf{a}$ in brackets.

To get unit vector, it's divided by its length. Use Pythagoras to do so.

$\therefore$ **Answer C**

	(iii) $\overrightarrow{AF} = \overrightarrow{AB} + \overrightarrow{BF} = \underline{c} + \frac{1}{3}\overrightarrow{BC}$ $= \frac{1}{3}\underline{b} + \frac{2}{3}\underline{c}$	(iii) Award 2: Correct solution simplified to one component of $\underline{b}$ and $\underline{c}$. Award 1: Some significant progress.
