1	This problem could be best solved graphically  We are given that the coordinates of P are (2, -2). The vector $\overrightarrow{PQ} = (-4, 6)$, so Q has coordinates (-2, 4). Given $\overrightarrow{PR} = 2\overrightarrow{PQ}$, $\overrightarrow{QR} = \overrightarrow{PQ}$ so R will have coordinates (-6, 10).	1	C
2	$\underline{a} + \underline{b} + \underline{c} = 2\underline{i} + 3\underline{j} - 3\underline{i} + 2\underline{j} + 2\underline{i} - \underline{j}$ $= \underline{i} + 4\underline{j}$ $2\underline{i} + 8\underline{j} = 2(\underline{i} + 4\underline{j})$ $= 2(\underline{a} + \underline{b} + \underline{c})$ then gives option B	1	B
3	Horizontal components: $x = 5 \cos 60^\circ + 8$ Vertical components: $y = 5 \sin 60^\circ + 0$ Magnitude = $\sqrt{x^2 + y^2}$ $= \sqrt{(5 \cos 60^\circ + 8)^2 + (5 \sin 60^\circ)^2}$ $= 11.3578..$ $= 11.36 N$ Direction : $\tan \theta = \frac{y}{x}$ $= \frac{5 \sin 60^\circ}{5 \cos 60^\circ + 8}$ $\therefore \theta = 22^\circ 24' 39.28''$ $= 22^\circ 25'$ (This step is not necessary as θ must be less than 60° , but you can use it as a check)	1	A
