Well done overall

- (i) Join XY Let $\angle BAX = x$, $\angle ABX = y$
 $\angle BXP = x + y$ (exterior angle of $\triangle ABX$)
 $\angle BAX = \angle AXY = x$ (angle between tangent and chord at point of contact equals angle in alternate segment) |_m

Similarly

$$\angle ABX = \angle BYX = y$$

$$\therefore \angle BXP = \angle QYP = x + y$$

$\therefore XPYQ$ is a cyclic quadrilateral
 (exterior angle equals opposite interior angle) |_m

- (ii) Join PQ $\angle XPQ = \angle QYX = x$ (angle at circumference standing on same arc as $XPYQ$ is cyclic)

$$\therefore \angle BAP = \angle XPQ = x$$

$\therefore AB \parallel QP$ (alternate angles equal.) |_m

- (iii) Extend YX to meet AB at M , & P at C

$$AM^2 = MX \cdot MY \quad \text{(: product of intercepts on secants equal to tangents squared)}$$

$$\text{Similarly } BM^2 = MX \cdot MY$$

$$\therefore AM^2 = BM^2$$

$$\therefore AM = BM \quad (AM > 0, BM > 0) \quad |_m$$

Some students do not know the exact theorem.

must mention ^{name of} alternate angles [^]

Most students do not realize this theorem

& give up.

In $\triangle AMY$, $\triangle QCY$

$AB \parallel QP$ (proved)

$\angle AMY = \angle QCY$ (corresponding angles on parallel lines)

$\angle AYM$ is common

$\triangle AMY \parallel \triangle QCY$ (equiangular)

$\therefore \frac{AM}{QC} = \frac{MY}{CY}$ (ratio of corresponding sides of similar triangles) I m

Similarly $\frac{BM}{PC} = \frac{MY}{CY}$

$$\therefore \frac{AM}{QC} = \frac{BM}{PC}$$

I m

As $AM = BM \therefore QC = PC$

$\therefore XY$ bisects PQ .

Students must show the ratio of corresponding sides of similar triangles to get I m not stopping at equiangular.

Note Students did not prove $AM = BM$ max / m
