After  $t$  hours, the tablet is a sphere with radius  $r$  mm, surface area  $A$  mm<sup>2</sup> and volume  $V$  mm<sup>3</sup>. The tablet dissolves with a rate of change of volume directly proportional to its surface area, such that

$$\frac{dV}{dt} = -k_1 A,$$

where  $k_1$  is a positive constant. Let  $V_0$  be the volume at  $t = 0$ .

**QUESTION FOURTEEN** (15 marks) Start a new answer booklet.

A soldier on the ground waits until the drone is directly above her before firing a bullet that leaves the gun at a speed of 300 m/s. You may assume that the magnitude of the acceleration due to gravity is  $10 \text{ m/s}^2$ .

(i) At what angle to the horizontal must she fire the bullet in order to hit the drone? 2

(ii) How high above the ground must the drone be so that it is too high to shoot down? 3

- (b) The rate of change of a tadpole population is given by the differential equation

$$\frac{dP}{dt} = rP \left( 1 - \frac{P}{k} \right)$$

where  $P$  is the number of tadpoles after  $t$  days, and  $r$  and  $k$  are positive constants. Initially, the pond is home to  $P_0$  tadpoles.

(i) Show that the tadpole population is increasing when  $0 < P < k$ . 1

(ii) Solve the differential equation to find  $P$  as a function of  $t$ . 3

(iv) Find an expression for the time when the rate of change of population is greatest. 2

- (c) Consider the sequence  $T_n = \sin(x + (n-1)y)$  for integers  $n \geq 1$ . 3

Use mathematical induction to show that, for  $n \geq 1$ ,

$$T_1 + T_2 + T_3 + \dots + T_n = \frac{\sin\left(x + \frac{1}{2}(n-1)y\right) \sin\left(\frac{1}{2}ny\right)}{\sin \frac{1}{2}y}.$$
