1. (g)

If there are 366 students and 366 days, then no student may share a birthday.

However with 1 more, at least 2 students may.

Hence if $2 \times 366 = 732$ students at least 2 may.

However with 1 more than 732, at least 3 may.

So with 900 students at least 3 may share a birthday, by the PHP.

[Similar argument if 365 days in a year are considered.]

OR From $n = dq + r$,
 $900 = 2 \times 366 + 168$

By PHP, at least $(2+1)$ students may share a birthday.

$$\therefore \tan^2 \theta = \frac{5 \pm 2\sqrt{5}}{5}$$

$$\tan \theta = \pm \sqrt{\frac{5 \pm 2\sqrt{5}}{5}}$$

since $\theta = \frac{\pi}{10}$ is a solution,

$\tan \frac{\pi}{10}$ is in the 1st quadrant

$$\therefore \tan \frac{\pi}{10} > 0$$

$$\therefore \tan \frac{\pi}{10} = \sqrt{\frac{5 \pm 2\sqrt{5}}{5}}$$

Now, $\tan \theta$ is an increasing function for $0 \leq \theta < \frac{\pi}{2}$,

$$c) i) T = 22 - Ae^{-kt}$$

$$\frac{dT}{dt} = (-k)(-Ae^{-kt})$$

$$= (-k)(22 - Ae^{-kt} - 22)$$

$$= (-k)(T - 22)$$

$\therefore T = 22 - Ae^{-kt}$ is a solution
to $\frac{dT}{dt} = (-k)(T - 22)$

$$ii) \text{ when } t=0, T=-8$$

$$-8 = 22 - Ae^{-k(0)}$$

$$A = 22 + 8$$

$$A = 30$$

$$iii) \text{ when } t=90, T=4$$

$$\therefore 4 = 22 - 30e^{-k(90)}$$

$$30e^{-90k} = 18$$

$$e^{-90k} = \frac{18}{30}$$

$$e^{-90k} = \frac{3}{5}$$

$$-90k = \ln \frac{3}{5}$$

$$k = -\ln \frac{3}{5}$$

$$90$$

$$\text{or } k = \frac{\ln \frac{5}{3}}{90}$$

$$iv) \text{ when } t=180$$

$$T = 22 - 30e^{\frac{\ln \frac{5}{3}}{90}(180)}$$

$$= 11.2$$

$$d) i) P(t) = \frac{6000}{3 + 7e^{-0.2t}}$$

$$\text{as } t \rightarrow \infty, e^{-0.2t} \rightarrow 0$$

$$\therefore P(t) \rightarrow \frac{6000}{3}$$

$$= 2000$$

$\therefore$ as $t \rightarrow \infty$, $P(t)$ approaches 2000

ii) When $P(t) = 1000$,

$$1000 = 6000$$

$$3 + 7e^{-0.2t}$$

$$3 + 7e^{-0.2t} = 6$$

$$7e^{-0.2t} = 3$$

$$e^{-0.2t} = \frac{3}{7}$$

$$-0.2t = \ln \frac{3}{7}$$

$$t = \frac{\ln \frac{3}{7}}{-0.2}$$

$$= 4.236489\dots$$

$$= 4.236 \text{ (4 sig. fig.)}$$
