(c) Double factorials are defined as follows:

$n!! = n(n-2)(n-4)\dots 6 \times 4 \times 2$, where n is an even positive integer

e.g. $10!! = 10 \times 8 \times 6 \times 4 \times 2$

$n!! = n(n-2)(n-4)\dots 5 \times 3 \times 1$, where n is an odd positive integer

e.g. $11!! = 11 \times 9 \times 7 \times 5 \times 3 \times 1$

(i) Show that $(2k)!! = k!2^k$ for even integers $n = 2k$.

1

$$\begin{aligned} (2k)!! &= (2k)(2k-2)(2k-4)\dots 2 \\ &= 2 \times k \times 2(k-1) \times 2(k-2) \times \dots \times 2 \times 1 \\ &= 2^k(k!) \text{ as there are } k \text{ terms} \end{aligned} \quad \left. \vphantom{\begin{aligned} (2k)!! &= (2k)(2k-2)(2k-4)\dots 2 \\ &= 2 \times k \times 2(k-1) \times 2(k-2) \times \dots \times 2 \times 1 \\ &= 2^k(k!) \end{aligned}} \right\} 1 \text{ mark}$$

(ii) Hence, prove that $(2k+1)!! = \frac{(2k+1)!}{k!2^k}$ for odd integers $n = 2k+1$.

2

$$\begin{aligned} (2k+1)!! &= (2k+1)(2k-1)(2k-3)\dots 5 \times 3 \times 1 \\ \times (2k)!! &\quad (2k+1)!! \times k!2^k = (2k+1)(2k)(2k-1)\dots 5 \times 4 \times 3 \times 2 \times 1 \\ &\quad \xrightarrow{\quad} (2k+1)!! \times k!2^k = (2k+1)! \quad \left. \vphantom{\begin{aligned} (2k+1)!! \times k!2^k &= (2k+1)! \\ \therefore (2k+1)!! &= \frac{(2k+1)!}{k!2^k} \end{aligned}} \right\} 1 \text{ mark} \end{aligned}$$

1 mark for using (i)

(iii) Hence, or otherwise, prove that $\int_0^{\frac{\pi}{2}} \cos^{2n}(x) dx = \frac{(2n)!\pi}{2^{2n+1}(n!)^2}$.

3

$$\begin{aligned} &\int_0^{\frac{\pi}{2}} \cos^{2n} x dx \\ &= \int_0^{\frac{\pi}{2}} \cos^{2n-1} x \cos x dx \\ u &= \cos^{2n-1} x & v' &= \cos x \\ u' &= (2n-1)(-\sin x) \cos^{2n-2} x & v &= \sin x \end{aligned}$$

$$\begin{aligned}
 \therefore \int_0^{\frac{\pi}{2}} \cos^{2n} x \, dx &= \left[\cos^{2n-1} x \sin x \right]_0^{\frac{\pi}{2}} + \int_0^{\frac{\pi}{2}} (2n-1) \sin^2 x \cos^{2n-2} x \, dx \\
 &= (2n-1) \int_0^{\frac{\pi}{2}} (1 - \cos^2 x) \cos^{2n-2} x \, dx \\
 &= (2n-1) \int_0^{\frac{\pi}{2}} \cos^{2n-2} x - \cos^{2n} x \, dx
 \end{aligned}$$

1 mark for integration by parts

Let $\int_0^{\frac{\pi}{2}} \cos^{2n} x \, dx = I_n$

$$\therefore I_{2n} = (2n-1) [I_{2n-2} - I_{2n}]$$

$$= 2n I_{2n-2} - 2n I_{2n} - I_{2n-2} + I_{2n}$$

$$\therefore 2n I_{2n} = (2n-1) I_{2n-2}$$

$$I_{2n} = \frac{2n-1}{2n} I_{2n-2}$$

$$= \frac{2n-1}{2n} \times \frac{2n-3}{2n-2} \times I_{2n-4}$$

$$= \frac{2n-1}{2n} \times \frac{2n-3}{2n-2} \times \frac{2n-5}{2n-4} \times \dots \times I_0$$

$$= \frac{(2n-1)!!}{(2n)!!} \int_0^{\frac{\pi}{2}} 1 \, dx$$

Also, from (i) $(2n-1)!! = \frac{(2n)!}{n! 2^n}$ as there is one less term

from (i) $(2n)!! = n! 2^n$

$$\therefore I_{2n} = \frac{(2n)!}{(n!)^2 2^{2n}} \times \frac{\pi}{2}$$

$$= \frac{(2n)! \pi}{(n!)^2 2^{2n+1}} \quad \square$$

Question 16 (14 marks) Use a SEPARATE writing booklet

- (a) A unit mass is projected vertically upwards with an initial speed of $S \text{ ms}^{-1}$ in a resisting medium that exerts a force of kv opposing the direction of motion, where k is a positive constant and the acceleration due to gravity is $g \text{ ms}^{-2}$.

5

Find an expression for the velocity, $v(t)$, independent of S , given that the mass reaches maximum height after T seconds.

Solution using S .

motion upwards $\uparrow$
 $V_0 = S$ and $m = 1$ $\therefore \ddot{y} = -g - kv$
 $\downarrow$ $m\ddot{y} = mg + kv$ down $\frac{dv}{dt} = -(g + kv)$

1 mark for establishing initial equation of motion

$$-\int_S^v \frac{1}{g + kv} dv = \int_0^t 1 dt$$

$$-\left[\frac{1}{k} \ln(g + kv)\right]_S^v = t$$

1 mark for integrating for v

$$\ln\left(\frac{g + kS}{g + kv}\right) = kt$$

$$\frac{g + kS}{g + kv} = e^{kt}$$

$$ge^{-kt} + kSe^{-kt} = g + kv$$

$$\therefore v = \frac{1}{k}(ge^{-kt} + kSe^{-kt} - g)$$

$$= \frac{g}{k}(e^{-kt} - 1) + Se^{-kt}$$

1 mark for a correct $v(t)$

when $v = 0, t = T$

$$\therefore 0 = \frac{g}{k}(e^{-kT} - 1) + Se^{-kT}$$

$$\frac{g}{k}(1 - e^{-kT}) = Se^{-kT}$$

$$S = \frac{g}{k}(e^{kT} - 1)$$

1 mark for progress in eliminating S using initial conditions

$$\therefore v = \frac{g}{k}(e^{-kt} - 1) + \frac{g}{k}(e^{kT} - 1)e^{-kt}$$

$$= \frac{g}{k}[e^{-kt} - 1 + e^{kT - kt} - e^{-kt}]$$

$$= \frac{g}{k}[e^{k(T-t)} - 1]$$

1 mark for result independent of S (accept results with m)

Alternative solution:

$$\frac{dv}{dt} = -g - kv$$

(1)

$$\int \frac{1}{kv+g} dv = \int -1 dt$$

$$\frac{1}{k} \ln(kv+g) = -t + C_1$$

(1)

$$\ln(kv+g) = -kt + C_2$$

$$kv+g = C_3 e^{-kt}$$

(1)

At maximum height, $v=0$, $t=T$

$$g = C_3 e^{-kT}$$

$$C_3 = g e^{kT}$$

(1)

$$\therefore kv+g = g e^{kT} e^{-kt}$$

$$v = \frac{g e^{k(T-t)} - g}{k}$$

(1) for $v(t)$

$$= \frac{g}{k} (e^{k(T-t)} - 1)$$

Non-calculus:

Consider $0 < x < 1$

$$-\frac{1}{2} < x - \frac{1}{2} < \frac{1}{2}$$

squaring gives $0 \leq (x - \frac{1}{2})^2 < \frac{1}{4}$

$$0 \leq x^2 - x + \frac{1}{4} < \frac{1}{4}$$

$$\frac{3}{4} \leq x^2 - x + 1 < 1$$

check discriminant for $x^2 - x + 1$

$$\Delta = 1^2 - 4$$

< 0 $\therefore$ no zeroes

$$\therefore \frac{4}{3} > \frac{1}{x^2 - x + 1} > 1$$

$$\text{i.e. } 1 < \frac{1}{x^2 - x + 1} \leq \frac{4}{3}$$

$$2 < \frac{2}{x^2 - x + 1} \leq \frac{8}{3}$$

$$1 < \frac{2}{x^2 - x + 1} - \frac{x^2 - x + 1}{x^2 - x + 1} \leq \frac{5}{3}$$

$$1 < \frac{1 + x - x^2}{x^2 - x + 1} \leq \frac{5}{3}$$

as required.

to prove:

① for correct progress/logic in proof e.g. using conditions or calculus

① left inequality e.g. proving $f(x) - 1 > 0$

① right inequality

e.g. proving $\frac{5}{3} - f(x) \geq 0$

Calculus: $f(x) = \frac{1+x-x^2}{1-x+x^2}$

$$= \frac{2 - 1+x-x^2}{1-x+x^2}$$

$$= \frac{2}{1-x+x^2} - 1$$

$$f'(x) = \frac{-2(-1+2x)}{(1-x+x^2)^2}$$

$$= 0 \text{ when } x = \frac{1}{2}$$

for $1-x+x^2$, $\Delta = 1^2 - 4$
 $< 0 \therefore$ no zeroes

$\therefore f(x)$ continuous

$$f\left(\frac{1}{2}\right) = \frac{5}{3} \text{ either max or min}$$

endpoints: $f(0) = 1$, $f(1) = 1$

$\therefore f\left(\frac{1}{2}\right)$ is max and $f(0)=f(1)$ min
