$$1. \int x \sec^2(x^2) dx = \frac{1}{2} \int 2x \sec^2(x^2) dx = \frac{1}{2} \tan(x^2) + C$$

$\therefore$ (A)

$$2. \cos \theta = \frac{a \cdot b}{|a||b|} = \frac{-2-2+1}{\sqrt{2^2+1+1} \times \sqrt{2^2+1+1}} = -\frac{1}{2}$$

$$\cos \theta = -\frac{1}{2} \therefore \text{in } Q2$$

(C)

$$3. \int_0^{\pi/3} \sin^3 x \cos^5 x dx = \int_0^{\pi/3} \sin^2 x \cdot \cos^5 x \cdot \sin x dx$$

$$= \int_0^{\pi/3} (1 - \cos^2 x) (\cos^5 x) \cdot \sin x dx$$

$$= -\int_{0.5}^1 (1 - u^2) (u^5) du$$

$$= -\int_{0.5}^1 (u^5 - u^7) du \therefore (D)$$

$$u = \cos x$$

$$du = -\sin x$$

$$x=0 \Rightarrow u=1$$

$$x=\pi/3 \Rightarrow u=0.5$$

4. point moves in a circle in (x+z) plane.
 and a straight line along y

$\therefore$ a cylinder centre (2,0,5) radius 3
 with base in x/z plane $\therefore$ (B)

(Q5)  let each small square side represent 1 unit in $\hat{i}, \hat{j}$ directn.

Then we need $\vec{OB} = (5\hat{i} + 5\hat{j})$

what we have is $\vec{OP}$ and $\vec{OR}$

$$\vec{OP} = \frac{5}{2}\hat{i} + 5\hat{j} \quad \vec{OR} = 5\hat{i} + \frac{5}{2}\hat{j}$$

$$\alpha \vec{OP} + \gamma \vec{OR} = \vec{OB}$$

(any point of Cartesian Plane can be represented as a linear combination of 2 non-parallel vectors in the plane....)

$$\alpha \begin{pmatrix} 5/2 \\ 5 \end{pmatrix} + \gamma \begin{pmatrix} 5 \\ 5/2 \end{pmatrix} = \begin{pmatrix} 5 \\ 5 \end{pmatrix}$$

$$5/2\alpha + 5\gamma = 5 \Rightarrow 5\alpha + 10\gamma = 10 \quad \text{--- (1)}$$

$$5\alpha + 5/2\gamma = 5 \Rightarrow 10\alpha + 5\gamma = 10 \quad \text{--- (2)}$$

Solving... $\alpha = \gamma = \frac{2}{3} \quad \therefore \quad \text{(B)}$

note! you could ^{just} eyeball it - making $\vec{OP} + \vec{OR} = \frac{15}{2}\hat{i} + \frac{15}{2}\hat{j}$ so the directn. is right so $\vec{OB}$ is just a scalar multiple of the sum, then use ratios....

(6) Note a 'circular spiral' in $x-z$ plane $\therefore$ The sin/cos pairs must be in the x, z positions so ~~eliminate~~
^{examine} now on the $y-z$ projection. also means $y = t$

z component is even wrt $y = t$

i.e. $z = f(t)$ must be an even function.

$\therefore$ ~~eliminate B~~ as $z = +\cos\pi t$ which is odd (odd $\times$ even = odd)

~~eliminate D~~ as again $z = +\cos\pi t$ which is odd.

must be (A) which is even $= 1 + \cos\pi t$

note! There are many approaches you don't have to use odd/even, usually you just follow the curves near transition points to see if the sign is correct and it is moving in the right direction.

Consider the two forms of scalar product.

$$\begin{pmatrix} a_1 \\ a_2 \\ a_3 \end{pmatrix} \cdot \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix} = |\underline{a}| |\underline{b}| \cos \theta$$

$$(a_1 b_1 + a_2 b_2 + a_3 b_3)^2 = (a_1^2 + a_2^2 + a_3^2) (b_1^2 + b_2^2 + b_3^2) \cos^2 \theta$$

$$(a_1 b_1 + a_2 b_2 + a_3 b_3)^2 \leq (a_1^2 + a_2^2 + a_3^2) (b_1^2 + b_2^2 + b_3^2) \quad \text{as } 0 \leq \cos^2 \theta \leq 1$$

$$(C) \int_0^{\pi/2} \frac{dx}{1 + \sin x + \cos x}$$

$$= \int_0^1 \frac{2 dt}{1+t^2+2t+1-t^2} = \int_0^1 \frac{2 dt}{2+2t}$$

$$= \int_0^1 \frac{dt}{1+t} = \left[\ln(1+t) \right]_0^1$$

$$= \ln 2$$

$$t = \tan \frac{x}{2}$$

$$\frac{dt}{dx} = \frac{1}{2} \sec^2 \frac{x}{2}$$

$$= \frac{1}{2} (1+t^2)$$

$$\therefore dx = \frac{2 dt}{1+t^2}$$

$$x=0 \quad t=0$$

$$x=\pi/2 \quad t=1$$

a(ii)

$$\int_1^K \ln x \, dx \approx \frac{b-a}{2n} (f(a) + f(b) + 2[f(x_1) + \dots + f(x_{n-1})])$$

in this case $f(x) = \ln x$

$K-1$ intervals $\therefore n = K-1$

$b=K \quad a=1$

$$\begin{aligned}
 \therefore \int_1^k \ln x dx &\approx \frac{k-1}{2(k-1)} (\ln 1 + \ln k + 2(\ln 2 + \ln 3 + \dots + \ln(k-1))) \\
 &= \frac{1}{2} (\ln k + 2(\ln 2 + \ln 3 + \dots + \ln(k-1))) \\
 &= \frac{1}{2} \ln k + \ln(2 \times 3 \times \dots \times (k-1)) \\
 &= \frac{1}{2} \ln k + \ln((k-1)!) \quad \checkmark \text{ as required.}
 \end{aligned}$$

(iii) as $\ln x$ concave down area of trapezia < exact area.

i.e. $\frac{1}{2} \ln k + \ln((k-1)!) < k \ln k - k + 1$

$$\ln k + \ln((k-1)!) < k \ln k - k + \frac{1}{2} \ln k + 1$$

$$\ln(k(k-1)!) < \ln k^k - \ln e^k + \ln \sqrt{k} + \ln e$$

$$\ln(k!) < \ln\left(\frac{k^k}{e^k} \cdot \sqrt{k} \cdot e\right)$$

$$\ln(k!) < \ln\left(e\sqrt{k} \left(\frac{k}{e}\right)^k\right)$$

$$k! < e\sqrt{k} \left(\frac{k}{e}\right)^k \quad \text{as required.}$$

(b) (i) RTP $\int_0^a f(x) dx = \int_0^a f(a-x) dx$

$$\begin{aligned}
 \text{RHS} &= \int_0^a f(a-x) dx = - \int_{u=a}^{u=0} f(u) du \\
 &= \int_0^a f(u) du
 \end{aligned}$$

$$\begin{aligned}
 u &= a-x \\
 du &= -dx \\
 dx &= -du
 \end{aligned}$$

$$\begin{aligned}
 x=0 & \quad u=a \\
 x=a & \quad u=0
 \end{aligned}$$

(u just placeholder)

$$= \int_0^a f(x) dx = \text{LHS}$$

(1)(b)

$$(ii) \quad I = \int_0^{\pi/2} \frac{e^{\sin x}}{e^{\sin x} + e^{\cos x}} dx$$

$$= \int_0^{\pi/2} \frac{e^{\sin(\pi/2 - x)}}{e^{\sin(\pi/2 - x)} + e^{\cos(\pi/2 - x)}} dx$$

$$= \int_0^{\pi/2} \frac{e^{\cos x}}{e^{\cos x} + e^{\sin x}} dx \quad (\text{complementary identity})$$

$$2I = \int_0^{\pi/2} \frac{e^{\sin x}}{e^{\sin x} + e^{\cos x}} dx + \int_0^{\pi/2} \frac{e^{\cos x}}{e^{\sin x} + e^{\cos x}} dx$$

$$= \int_0^{\pi/2} \left(\frac{e^{\sin x}}{e^{\sin x} + e^{\cos x}} + \frac{e^{\cos x}}{e^{\sin x} + e^{\cos x}} \right) dx$$

$$= \int_0^{\pi/2} \frac{e^{\sin x} + e^{\cos x}}{e^{\sin x} + e^{\cos x}} dx$$

$$= \int_0^{\pi/2} 1 dx = \left[x \right]_0^{\pi/2}$$

$$2I = \pi/2$$

$$\therefore I = \underline{\underline{\pi/4}}$$

(Q12) (a)

$$\begin{aligned}
 \text{(i)} \quad \vec{CM} &= \vec{CM} + \vec{AM} \\
 &= -\vec{OA} + \frac{1}{2}(\vec{AB}) \\
 &= -\vec{a} + \frac{1}{2}(\vec{OB} - \vec{OA}) \\
 &= -\vec{a} + \frac{1}{2}\vec{b} - \frac{1}{2}\vec{a}
 \end{aligned}$$

$$\vec{CM} = -\frac{3}{2}\vec{a} + \frac{1}{2}\vec{b}$$

$$\begin{aligned}
 \text{(ii)} \quad \vec{ON} &= \vec{OC} + \vec{CN} \\
 &= \vec{OC} + \lambda \vec{CM} \\
 &= 2\vec{a} + \lambda(-\frac{3}{2}\vec{a} + \frac{1}{2}\vec{b}) \\
 &= (2 - \frac{3}{2}\lambda)\vec{a} + \frac{1}{2}\lambda\vec{b} \quad \checkmark \text{ as required.}
 \end{aligned}$$

(iii) we note $\vec{ON}$ has no $\vec{a}$ component

$$\therefore (2 - \frac{3}{2}\lambda)\vec{a} = \vec{0} \quad \text{i.e.} \quad 2 - \frac{3}{2}\lambda = 0$$

$$2 - \frac{3}{2}\lambda = 0 \quad \frac{3}{2}\lambda = 2 \quad \therefore \quad \underline{\underline{\lambda = \frac{4}{3}}}$$

Sub back into equation for $\vec{ON}$

$$\vec{ON} = 0\vec{a} + \frac{1}{2} \cdot \frac{4}{3} \vec{b}$$

$$\vec{ON} = \frac{2}{3}\vec{OB}$$

$\therefore$ N divides OB in the ratio 2:1

$$ON:NB = 2:1$$

Q12) 6)

$$N = 100a + 10b + c$$

$$\text{RTP } N = 11M \quad \text{iff} \quad a - b + c = 11K \quad N, K, M \in \mathbb{Z}$$

$$\Rightarrow a - b + c = 11K$$

$$100a + 10b + c = 99a + a + 11b - b + c$$

$$= 99a + 11b + a - b + c$$

$$= 11(9a + b) + 11K \quad \text{which is divisible by 11}$$

$$\Leftarrow N = 11M$$

$$100a + 10b + c = 11M$$

$$99a + 11b + a - b + c = 11M$$

$$a - b + c = 11M - 99a - 11b$$

$$= 11(M - 9a - b)$$

which is divisible by 11

$\therefore N$ is divisible by 11 iff $a - b + c$ is divisible by 11

(i.e. N is divisible by 11 iff the difference between the sum of its digits in odd positions, and sum of its digits in even digits is divisible by 11 (for a 3 digit number))

note can do for 4 digits etc... but for general case need modulo arithmetic which is beyond the syllabus...
