

2007
YEARLY EXAMINATION

Preliminary Mathematics

General Instructions

- Reading Time – 5 minutes
- Working Time – 2 hours
- Write using black or blue pen
- Board-approved calculators may be used
- A table of standard integrals is provided at the back of this paper
- All necessary working should be shown in every question

Total Marks – 84

Attempt Questions 1–7

All questions are of equal value

At the end of the examination, place your answer sheets in order and put this question paper on top. Submit one bundle. The bundle will be separated for marking so please ensure your name is written on EVERY PAGE.

Student Name: _____ Teacher: _____

Total Marks – 84

Attempt Questions 1–7 All questions are of equal value

Begin each question on a new page.

Question 1 (12 marks)

Marks

- a) Find the value of $\frac{\sqrt[4]{389}}{3+4^2}$ correct to 3 significant figures. **2**
- b) Simplify $5\sqrt{7} - \frac{7}{\sqrt{7}}$, expressing your answer with a single rational denominator. **2**
- c) Factorise $x^3 + 2x^2 + x + 2$ **2**
- d) Evaluate in exact form $\sin 120^\circ(\sin 30^\circ + \cos 45^\circ)$ **2**
- e) Solve $5m^2 + 2m - 3 = 0$ **2**
- f) Simplify $\frac{3}{x+3} - \frac{6x}{x^2-9}$ **2**

Question 2 (12 marks) **Start a new page**

a) Differentiate with respect to x . Give your answers in simplest form.

i) $y = \frac{x^3}{3} - 1$ **1**

ii) $y = x(x-1)^2$ **1**

iii) $y = \frac{3x^3 - 4x^2}{x}$ **1**

iv) $y = -\frac{3}{2}\sqrt[3]{x^2}$ **2**

b) The gradient of the tangent to the curve $y = ax^2 - 8x + 10$ is 4 when $x = 2$. Find the value of a . **2**

c) Show that the tangents at the points (1, -3) and (0, -3) on the curve $y = x^2 - x - 3$ are perpendicular to each other. **3**

d) Given that $\operatorname{cosec} \alpha = 4$ and α is acute, find the value of $\tan \alpha$. **2**

Question 3 (12 marks)**Start a new page**

a) i) Determine the gradient of a straight line with an angle of inclination of 135° . **1**

ii) Find the equation of a line with this gradient and an x intercept of $\frac{2}{5}$.
Express your answer in general form. **2**

b) Show that the perpendicular distance from a point $P(1, 7)$ to the line $2y = x + 3$ is $2\sqrt{5}$ units. **2**

c) A function $g(x)$ is the function defined by

$$g(x) = \begin{cases} -1 & \text{for } x \leq -1 \\ x^2 - 2 & \text{for } -1 < x < 1 \\ -\frac{1}{x} & \text{for } x \geq 1 \end{cases}$$

i) State the range of $g(x)$. **2**

ii) Evaluate $g(2) - 2g(0) + g(-3)$ **3**

d) Write three inequations satisfied by all points in the shaded region below. **2**

Question 4 (12 marks) **Start a new page**

- a) Using the following diagram, state three ratios equal to $BG : CD$

2

- b) $ABCD$ is a parallelogram, shown in the diagram to the right.

AB is produced to E and CD is produced to H so that $BE = DH$.

EH meets BC and AD at F and G respectively.

- i) Copy the diagram onto your answer sheet.

- ii) Prove $\triangle BEF \equiv \triangle DHG$.

3

- iii) Hence prove that $AG = CF$.

2

- c) The line $ax + by - 3 = 0$ is perpendicular to the line $2x - y + 5 = 0$ and passes through the point $(1, 1)$. Find the value of a and b .

3

- d) A straight line passes through the points $A(2k - 1, 2k + 1)$ and $B(k - 1, k + 1)$. Show that the equation of AB is $y = x + 2$.

2

Question 5 (12 marks) **Start a new page**

- a) Find the smallest angle of a triangle with sides 10cm, 16cm and 18cm. **2**
- b) From a Qantas jet maintaining a constant altitude, the angle of depression of Sydney Tower is 20° . After flying 500m in a horizontal direction away from the tower, the angle of depression is 15° . Find the altitude of the plane, given that Sydney Tower has a height of 309m. **3**
- c) Nemo swims 10km due East from his Dad and then 5km on a bearing of 050°T .
- i) Find the distance from Nemo to his Dad to the nearest km.
- ii) Find the bearing of Nemo from his Dad to the nearest degree. **4**
- d) Solve $\sin 2\theta = \frac{9}{20}$ for $0^\circ \leq \theta \leq 360^\circ$ **3**

Question 6 (12 marks) **Start a new page**

- a) Given that $\cos x = \sin(x + 25^\circ)$, find the value of x for $0^\circ \leq x \leq 90^\circ$. **1**
- b) Prove $(\operatorname{cosec} x + \cot x)^2 = \frac{1 + \cos x}{1 - \cos x}$ **3**
- c) At what point(s) on the curve $y = x^3 - \frac{3}{2}x^2 - 12x - 1$ is the gradient of the tangent equal to -6 ? **3**
- d) Find $\lim_{x \rightarrow 1} \frac{x^2 + 2x - 3}{x - 1}$ **2**
- e) For the curve $y = ax^2 + bx + c$, where a , b and c are constants, it is given that $\frac{dy}{dx} = -y$ when $x = -2$. Show that b is equal to c . **3**

Question 7 (12 marks)

Start a new page

- a) In the diagram below, A, B and C are collinear. $AD = AB$, $BC = EC$ and $AD \perp EC$.
Prove that $\angle DBE$ is a right angle.

3

- b) Give the equation of the function whose graph appears below.

2

- c) For the function $f(x) = (x^2 - 5x)^2 - 36$:

- Determine algebraically whether the function is odd, even or neither.
- Factorise fully $f(x)$.
- Evaluate $f(\frac{5}{2})$.
- Neatly sketch $f(x)$ showing all key features and intercepts.

☺ Year 11 Preliminary Mathematics Examination 2007 – Solutions ☺

Question 1

a) 0.234 (3 sf)

b) $\frac{28\sqrt{7}}{7} \quad (\neq 4\sqrt{7})$

c) $= x^2(x+2) + (x+2)$
 $= (x^2 + 1)(x+2)$

d) $= \frac{\sqrt{3}}{2} \left(\frac{1}{2} + \frac{1}{\sqrt{2}} \right)$
 $= \frac{\sqrt{3}}{2} \left(\frac{1+\sqrt{2}}{2} \right)$
 $= \frac{\sqrt{3} + \sqrt{6}}{4}$

e) $(m+1)(5m-3) = 0$
 $m = -1 \quad \text{or} \quad m = \frac{3}{5}$

f) $\frac{3}{x+3} - \frac{6x}{x^2-9} = \frac{3(x-3)-6x}{(x+3)(x-3)}$
 $= \frac{-3x-9}{(x+3)(x-3)}$
 $= \frac{-3}{x-3}$

Question 2

a) i) $\frac{dy}{dx} = \frac{3x^2}{3} = x^2$

ii) $y = x(x^2 - 2x + 1)$
 $= x^3 - 2x^2 + x$
 $\frac{dy}{dx} = 3x^2 - 4x + 1$

iii) $y = 3x^2 - 4x$
 $\frac{dy}{dx} = 6x - 4$

iv) $y = -\frac{3}{2}x^{\frac{2}{3}}$
 $\frac{dy}{dx} = -\frac{3}{2} \times \frac{2}{3}x^{-\frac{1}{3}}$
 $= -\frac{1}{\sqrt[3]{x}}$

b) $\frac{dy}{dx} = 2ax - 8$

when $x = 2$,
 $4 = 2(2)a - 8$
 $12 = 4a$
 $\therefore a = 3$

c) $\frac{dy}{dx} = 2x - 1$

When $x = 1$,
 $\frac{dy}{dx} = 2(1) - 1$
 $= 1$

So, gradient of tangent at $x = 1$ is 1.

When $x = 0$,
 $\frac{dy}{dx} = 2(0) - 1$
 $= -1$

So, gradient of tangent at $x = 0$ is -1 .

In perpendicular lines, $m_1 m_2 = -1$

$1 \times -1 = -1$, $\therefore$ tangents at $x = 1$ and $x = 0$ are perpendicular.

d) $\operatorname{cosec} \alpha = 4$
 $\sin \alpha = \frac{1}{4}$

Using Pythagoras,
 $x^2 + 1^2 = 4^2$
 $x = \sqrt{15}$

$\therefore \tan \alpha = \frac{1}{\sqrt{15}}$

Question 3

a) i) $m = \tan \theta$
 $m = \tan 135^\circ$
 $= -1$

ii) $m = -1; \quad (\frac{2}{5}, 0)$
 $y - y_1 = m(x - x_1)$
 $y = -1(x - \frac{2}{5})$
 $y = -x + \frac{2}{5}$
 $5x + 5y - 2 = 0$

b) $x - 2y + 3 = 0; \quad (1, 7)$

$$d = \frac{|ax_1 + by_1 + c|}{\sqrt{a^2 + b^2}}$$

$$d = \frac{|1(1) - 2(7) + 3|}{\sqrt{1^2 + (-2)^2}}$$

$$= \frac{|-10|}{\sqrt{5}}$$

$$= \frac{10\sqrt{5}}{5}$$

$$= 2\sqrt{5}$$

c) i) $-2 \leq y < 0$

ii) $g(2) - 2g(0) + g(-3) = -\frac{1}{2} - 2(0^2 - 2) - 1$
 $= 2\frac{1}{2}$

d) $x \geq 0; \quad y \geq x^2 - 2; \quad y \leq x$

Question 4

a) $AG : AD \quad AB : AC \quad FE : FD$

b) ii) $\angle ADC = \angle ABC$ (opposite angles of a parallelogram are equal)
 $\angle GDH = 180^\circ - \angle ADC$ (straight angle HDC)
and $\angle FBE = 180^\circ - \angle ABC$ (straight angle ABE)
 $\therefore \angle GDH = \angle FBE$

In $\triangle BEF$ and $\triangle DHG$:

$BE = DH$ (given)
 $\angle FBE = \angle GDH$ (proven above)
 $\angle BEF = \angle GHD$ (alternate angles are equal, $AB \parallel CD$)
 $\therefore \triangle BEF \equiv \triangle DHG$ (AAS)

iii) $BF = GD$ (matching sides in congruent triangles, $\triangle BEF \equiv \triangle DHG$)
 $BC = AD$ (opposite sides of a parallelogram are equal)
 $BC - BF = AD - GD$
 $\therefore CF = AG$

c) First, find the gradient of $2x - y + 5 = 0$:
 $y = 2x + 5$
 $\therefore m = 2$

In perpendicular lines, $m_1 m_2 = -1$, so gradient of line $ax + by - 3 = 0$ must be $-\frac{1}{2}$.

Using the point (1, 1):

$$y - y_1 = m(x - x_1)$$

$$y - 1 = -\frac{1}{2}(x - 1)$$

$$2y - 2 = -x + 1$$

$$x + 2y - 3 = 0$$

$$\therefore a = 1; b = 2.$$

d) Method 1: Using the two-point formula:

$$\frac{y - y_1}{x - x_1} = \frac{y_2 - y_1}{x_2 - x_1}$$

$$\frac{y - (2k + 1)}{x - (2k - 1)} = \frac{k + 1 - (2k + 1)}{k - 1 - (2k - 1)}$$

$$\frac{y - 2k - 1}{x - 2k + 1} = \frac{-k}{-k}$$

$$= 1$$

$$y - 2k - 1 = x - 2k + 1$$

$$y = x + 2$$

Method 2: Using point and gradient:

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} \\ &= \frac{k + 1 - (2k + 1)}{k - 1 - (2k - 1)} \\ &= \frac{-k}{-k} \\ &= 1 \end{aligned}$$

Then, using $B(k - 1, k + 1)$:

$$y - y_1 = m(x - x_1)$$

$$y - (k + 1) = x - (k - 1)$$

$$y - k - 1 = x - k + 1$$

$$y = x + 2$$

Question 5

a) The smallest angle of a triangle is opposite the shortest side.

Using cosine rule:

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$\begin{aligned} \cos x &= \frac{18^2 + 16^2 - 10^2}{2 \times 18 \times 16} \\ &= \frac{480}{576} \\ x &= 33.56^\circ \end{aligned}$$

b)

Using right angled triangles,

$$\tan 20^\circ = \frac{h}{x} \quad \text{and} \quad \tan 15^\circ = \frac{h}{500+x}$$

$$\therefore x = \frac{h}{\tan 20^\circ} \quad \therefore x = \frac{h - 500 \tan 15^\circ}{\tan 15^\circ}$$

Eliminating x ,

$$\frac{h}{\tan 20^\circ} = \frac{h - 500 \tan 15^\circ}{\tan 15^\circ}$$

$$h \tan 15^\circ = h \tan 20^\circ - 500 \tan 15^\circ \tan 20^\circ$$

$$500 \tan 15^\circ \tan 20^\circ = h (\tan 20^\circ - \tan 15^\circ)$$

$$h = \frac{500 \tan 15^\circ \tan 20^\circ}{\tan 20^\circ - \tan 15^\circ}$$

$$= 507.834160 \dots$$

$$\text{Altitude of plane} = h + 309$$

$$= 817 \text{m (nearest m)}$$

c)

i) Using cosine rule:

$$a^2 = b^2 + c^2 - 2bc \cos A$$

$$\therefore d^2 = 10^2 + 5^2 - 2 \times 10 \times 5 \times \cos 140^\circ$$

$$= 125 + 76.604444 \dots$$

$$= 201.604444 \dots$$

$$d = 14.198747 \dots$$

$$= 14 \text{km (nearest km)}$$

ii) Using sine rule:

$$\frac{\sin x}{5} = \frac{\sin 140^\circ}{14.198747 \dots}$$

$$\sin x = \frac{5 \sin 140^\circ}{14.198747 \dots}$$

$$= 0.226353 \dots$$

$$x = 13.082488 \dots$$

$$= 13^\circ \text{ (nearest deg)}$$

Bearing of Nemo from Dad is
 $(90 - 13)^\circ \text{T} = 077^\circ \text{T}$.

d) Let $u = 2\theta$ $0^\circ \leq 2\theta \leq 720^\circ$

$$\therefore \sin u = \frac{9}{20}$$

$$u = 26.74368 \dots^\circ \text{ or } 153.25631 \dots^\circ$$

$$\text{or } 386.74368 \dots^\circ \text{ or } 513.25631 \dots^\circ$$

$$\therefore 2\theta = 26.74368 \dots^\circ \text{ or } 153.25631 \dots^\circ$$

$$\text{or } 386.74368 \dots^\circ \text{ or } 513.25631 \dots^\circ$$

$$\theta = 13.37^\circ, 76.63^\circ, 193.37^\circ,$$

$$256.63^\circ \text{ (2dp)}$$

Question 6

a) $\cos a = \sin(90^\circ - a)$

$$\therefore x = 90^\circ - (x + 25^\circ)$$

$$x = 90^\circ - x - 25^\circ$$

$$2x = 65^\circ$$

$$x = 32.5^\circ$$

b) $\text{LHS} = (\operatorname{cosec} x + \cot x)^2$

$$= \operatorname{cosec}^2 x + 2 \operatorname{cosec} x \cot x + \cot^2 x$$

$$\begin{aligned}
&= \frac{1}{\sin^2 x} + 2 \times \frac{1}{\sin x} \times \frac{\cos x}{\sin x} + \frac{\cos^2 x}{\sin^2 x} \\
&= \frac{1 + 2 \cos x + \cos^2 x}{\sin^2 x} \\
&= \frac{(1 + \cos x)^2}{1 - \cos^2 x} \\
&= \frac{(1 + \cos x)^2}{(1 + \cos x)(1 - \cos x)} \\
&= \frac{1 + \cos x}{1 - \cos x} \\
&= \text{RHS}
\end{aligned}$$

c) $y = x^3 - \frac{3}{2}x^2 - 12x - 1$

$$\frac{dy}{dx} = 3x^2 - 3x - 12$$

If $m = -6$:

$$-6 = 3x^2 - 3x - 12$$

$$0 = 3x^2 - 3x - 6$$

$$0 = x^2 - x - 2$$

$$0 = (x - 2)(x + 1)$$

$$\therefore x = 2 \text{ or } x = -1$$

When $x = 2$, $y = 2^3 - \frac{3}{2}(2)^2 - 12(2) - 1$
 $= -23$

When $x = -1$, $y = (-1)^3 - \frac{3}{2}(-1)^2 - 12(-1) - 1$
 $= 8.5$

$\therefore (2, -23)$ and $(-1, 8.5)$ are the two points.

d) $\lim_{x \rightarrow 1} \frac{x^2 + 2x - 3}{x - 1}$
 $= \lim_{x \rightarrow 1} \frac{(x - 1)(x + 3)}{x - 1}$

$$\begin{aligned}
&= \lim_{x \rightarrow 1} x + 3 \\
&= 1 + 3 \\
&= 4
\end{aligned}$$

e) $y = ax^2 + bx + c$
when $x = -2$, $y = a(-2)^2 + b(-2) + c$
 $= 4a - 2b + c$
 $\therefore -y = -4a + 2b - c$

$$\frac{dy}{dx} = 2ax + b$$

when $x = -2$, $\frac{dy}{dx} = 2a(-2) + b$
 $= -4a + b$

when $x = -2$, $\frac{dy}{dx} = -y$
 $-4a + b = -4a + 2b - c$
 $-b = -c$
 $\therefore b = c$

Question 7

a) Let $\angle ADB = a$

$$\angle DBA = a \quad (\text{equal angles opposite equal sides})$$

$$\angle DAB = 180^\circ - 2a \quad (\text{angle sum } \triangle ADB)$$

$$\angle DAB + \angle ECB = 180^\circ \quad (\text{cointerior } \angle s \text{ are supplementary, } AD \parallel EC)$$

$$\therefore \angle ECB = 2a$$

$$\angle EBC = \angle BEC \quad (\text{equal angles opposite equal sides})$$

$$\angle EBC = \frac{180^\circ - 2a}{2} \quad (\text{angle sum } \triangle BEC)$$

$$= 90^\circ - a$$

$$\angle DBA + \angle DBE + \angle EBC = 180^\circ \quad (\text{straight angle } ABC)$$

$$\angle DBE = 180^\circ - a - (90^\circ - a)$$

$$= 90^\circ$$

$\therefore \angle DBE$ is a right angle.

b) $f(x) = 4 - 3|x + 1|$

c) i) $f(a) = (a^2 - 5a)^2 - 36$

$$f(-a) = [(-a)^2 - 5(-a)]^2 - 36$$

$$= (a^2 + 5a)^2 - 36$$

$$f(a) \neq f(-a) \text{ or } -f(-a)$$

$\therefore$ function is neither odd nor even.

ii) $(x^2 - 5x)^2 - 36$

$$= (x^2 - 5x)^2 - 6^2$$

$$= (x^2 - 5x - 6)(x^2 - 5x + 6)$$

$$= (x - 6)(x + 1)(x - 3)(x - 2)$$

iii) $f(\frac{5}{2}) = [(\frac{5}{2})^2 - 5(\frac{5}{2})]^2 - 36$

$$= (\frac{25}{4} - \frac{25}{2})^2 - 36$$

$$= \frac{49}{16}$$

iv) Note: function is not even, but is symmetrical about $x = \frac{5}{2}$.
