Question 9

(9)(a)

$$(k+2)x^2 - 2kx - 11 = 0$$

for real roots $\Delta \geq 0$

$$(k+2)^2 - 4 \times 1 \times (-11) \geq 0$$

$$k^2 + 4k + 4 + 44 \geq 0$$

$$k^2 + 4k + 48 \geq 0$$

$$(k+12)(k+4) \geq 0$$

$$k \leq -12, k \geq -4$$

(b)

(i) $V = Ae^{-kt}$

$t = 0, V = 120\,000 \therefore A = 120\,000$

$t = 2, V = 95\,000$

$\therefore 95\,000 = 120\,000e^{-2k}$

$\frac{19}{24} = e^{-2k}$

$\log \frac{19}{24} = -2k$

$\therefore k = -\frac{1}{2} \log \frac{19}{24}$

$= 0.1168..$

$= 0.117(3dp)$

(ii) When $t = 10$

$V = 120\,000e^{-10 \times 0.1168..}$

$= 37\,315.82$

(iii)

$120\,000e^{-kt} < 60\,000$

$e^{-kt} < \frac{1}{2}$

$-kt < \log \frac{1}{2}$

$\log \frac{1}{2}$

$t > \frac{\log \frac{1}{2}}{-k}$

$t > 5.92$

$\therefore$ during 2005

(c) i)

For $0 < t < 4$, $a = 4 \text{ m/s}^2$

$v = 4t + c$

@ $t = 0$, $v = 0 \therefore c = 0$

$\therefore v = 4t$ for $0 < t < 4$

@ $t = 4$, $v = 4(4) = 16 \text{ m/s}$

Alternatively to find the velocity @ $t = 4$ s,

$v =$ Area of rectangle of sides 4 by 4 = 16 m/s. Then the particle travels with this constant velocity as $a = 0$ when $4 < t < 6$.

$\therefore v = 16 \text{ m/s}$ for $4 < t < 6$

ii)

$x = A_1 + A_2$

$= \frac{4 \times 16}{2} + 16 \times 2$

$= 32 + 32 = 64 \text{ m}$

Alternatively,

$x = \int_0^4 4t dt + \int_4^6 16 dt$

$= \left[2t^2 \right]_0^4 + \left[\frac{16t}{1} \right]_4^6$

$= 32 + 16(6) - 16(4)$

$= 32 + 32$

$= 64 \text{ m}$

Question 10

a) $h=a$

x	0	a	$2a$
y	$a+10$	a	$a-10$

$$A = \frac{h}{3}(y_1 + 4y_2 + y_3)$$

$$3200 = \frac{a}{3}(a+10+4a+a-10)$$

$$3200 = \frac{a}{3}(6a)$$

$$2a^2 = 3200$$

$$a^2 = 1600$$

$$a = \pm 40 \quad (a > 0)$$

$$\Rightarrow a = 40$$

Question 10

1 for correct
simpson's
equation
applied in this
question

1 for solving
equation

1 for $a = 40$
(0 for $\pm$)

b) (i)
1 for PS

1 for PQ

(ii)

1 for GQ

1 for showing
the given time
equation

b) (i)

Also, $PQ + QS = PS$ where $PS^2 = 200^2 - 100^2 = 30000$ (Pythagoras theorem)

Hence $PS = 100\sqrt{3}$ and as $PQ = 100 \tan \theta$ we find $QS = 100(\sqrt{3} - \tan \theta)$.

(ii)

Now $100 = GQ \cos \theta$ so $GQ = \frac{100}{\cos \theta}$

The time of travel T (in seconds) is given by $\frac{\text{distance travelled}}{\text{speed}}$ for the trip sections

$$T = \frac{GQ}{1.6} + \frac{QS}{4}$$

$$T = \frac{100}{1.6 \cos \theta} + \frac{100}{4}(\sqrt{3} - \tan \theta)$$

$$T = \frac{125}{2 \cos \theta} + 25(\sqrt{3} - \tan \theta)$$

(iii)

$$\frac{dT}{d\theta} = \frac{100}{1.6} \left(\frac{\sin \theta}{\cos^2 \theta} \right) - \frac{25}{\cos^2 \theta}$$

for a stationary point

$$\Rightarrow 100 \sin \theta = 25 \times 1.6$$

$$\Rightarrow \sin \theta = 0.4$$

$$\text{so } \theta = 23.57^\circ \text{ or } = 23^\circ 35'$$

Testing:

$$\theta = 0, \quad \frac{dT}{d\theta} = 0 - \frac{25}{1} = -25$$

$$\theta = 30, \quad \frac{dT}{d\theta} = \frac{100}{1.6} \left(\frac{0.5}{0.75} \right) - \frac{25}{0.75} \approx 8.33$$

θ	0	23.57°	30°
$\frac{dT}{d\theta}$	-25	0	8.33
T		Min	

(iv)

The minimum time occurs when $\sin \theta = 0.4$ and hence $\cos \theta = \sqrt{0.84}$

This is about 100.6 seconds.

Also Accept 1 min 36 seconds
