$$\begin{array}{l|l} \text{now } y = x^2 + 4 & y = x^2 - 2x \\ y' = 2x & y' = 2x - 2 \\ \therefore m_1 = -4 & m_2 = -6. \end{array}$$

$$\begin{aligned} \tan \theta &= \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| \\ &= \left| \frac{-4 - (-6)}{1 + (-4)(-6)} \right| \\ &= \left| \frac{-4 + 6}{1 + 24} \right| \\ &= \frac{2}{25} \end{aligned}$$

$h = -5 \tan^2 \alpha + 20 \tan \alpha - 5$

Max. value of h occurs

when $\tan \alpha = \frac{-20}{2(-5)} = 2$

ie $\tan \alpha = 2$

Max height is

$-5(2)^2 + 20(2) - 5 = 15 \text{ metres}$

(b) $\frac{d}{dx} \left(\frac{1}{2} v^2 \right) = -9x + 5(x-2)^{-2}$

$\frac{1}{2} v^2 = -\frac{9x^2}{2} + \frac{5}{2-x} + C$

$\left. \begin{matrix} x=0 \\ v=0 \end{matrix} \right\} \Rightarrow C = -\frac{5}{2}$

$\therefore v^2 = -9x^2 + \frac{5}{2-x} - 5$

(b) $v^2 = -9x^2 + \frac{10}{2-x} - 5$

For motion to exist then

$v^2 \geq 0$

ie $-9x^2 + \frac{10}{2-x} - 5 \geq 0$

$-9x^2(2-x)^2 + 10(2-x) - 5(2-x)^2 \geq 0$

$(2-x) [-9x^2(2-x) + 10 - 5(2-x)] \geq 0$

i $(2-x)(-18x^2 + 9x^3 + 5x) \geq 0$

ii $(2-x) \cdot x(9x^2 - 18x + 5) \geq 0$

$x(2-x)(3x-5)(3x-1) \geq 0$

SOLUTION

$0 \leq x \leq \frac{1}{3}$ $\frac{5}{3} \leq x \leq 2$

However since particle starts at zero and changes direction at $x = \frac{1}{3}$ it can never be outside the interval $0 \leq x \leq \frac{1}{3}$.

Note For $\frac{1}{3} < x < \frac{5}{3}$ $v^2 < 0$

* impossible to move in this interval and therefore cannot move in $\frac{5}{3} \leq x \leq 2$.

Ultimately moves in interval

$0 \leq x \leq \frac{1}{3}$

⑦ (c) RHS = $\tan(\alpha + \beta) [1 - \tan \alpha \tan \beta]$
 (i) $= \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} [1 - \tan \alpha \tan \beta]$
 $= \tan \alpha + \tan \beta$
 $= \text{LHS}$

(ii) When $n=1$ $\tan \theta \cdot \tan 2\theta = \tan 2\theta \cot \theta - 2$
 $\text{RHS} = \frac{2 \tan \theta}{1 - \tan^2 \theta} \cdot \frac{1}{\tan \theta} - 2 = \frac{2 \tan^2 \theta}{1 - \tan^2 \theta} = \tan \theta \cdot \frac{2 \tan \theta}{1 - \tan^2 \theta}$
 $= \tan \theta \cdot \tan 2\theta = \text{LHS}$

- Assume $\tan \theta \tan 2\theta + \dots + \tan k\theta \tan (k+1)\theta = \tan (k+1)\theta \cot \theta - (k+1)$

RTP $\tan \theta \tan 2\theta + \dots + \tan k\theta + \tan (k+1)\theta + \tan (k+1)\theta \tan (k+2)\theta = \tan (k+2)\theta \cot \theta - (k+2)$

Now LHS = $\tan (k+1)\theta \cdot \cot \theta - (k+1) + \tan (k+1)\theta \tan (k+2)\theta$
 $= \cot \theta [\tan (k+1)\theta + \tan (k+1)\theta \cdot \tan (k+2)\theta \cdot \tan \theta] - (k+1)$
 $= \cot \theta [\tan (k+1)\theta + \tan (k+2)\theta \left(1 - \frac{\tan (k+1)\theta + \tan \theta}{\tan (k+2)\theta}\right)] - (k+1)$
 $= \cot \theta [\tan (k+1)\theta + \tan (k+2)\theta - \tan (k+1)\theta - \tan \theta] - (k+1) \quad \leftarrow \text{using (i)}$
 $= \cot \theta [\tan (k+2)\theta - \tan \theta] - (k+1)$
 $= \cot \theta [\tan (k+2)\theta] - 1 - (k+1)$
 $= \cot \theta [\tan (k+2)\theta] - (k+2) = \text{RHS}$
