Note $\sqrt{4 - x^2}$ is a semicircle.

$$\text{so Area} = 2 \left[8x - \frac{2x^3}{3} \right]_0^2 - \frac{2\pi(2)^2}{4}$$

Question 7

a) Let $\alpha = \cos^{-1} \frac{2}{3}$, $\beta = \tan^{-1} \frac{3}{4}$
 $-\beta = \tan^{-1} \left(-\frac{3}{4} \right)$

$$\begin{aligned} \sin(\alpha - \beta) &= \sin \alpha \cos \beta - \cos \alpha \sin \beta \\ &= \frac{\sqrt{5}}{3} \times \frac{4}{5} - \frac{2}{3} \times \frac{3}{5} \\ &= \frac{4\sqrt{5} - 6}{15} \end{aligned}$$

b) i)

①

Note:

Many students let $\beta = \tan^{-1} \left(-\frac{3}{4} \right)$ then did not consider that β must then be in 4th quadrant.

① diagrams

① correct substitution into sum/diff. expansion

① simplification

① correct domain

① correct range

b)ii) Method 1 - Area bounded by curve WRT y-axis:

$$y = 2\cos^{-1}(x-1)$$

$$\frac{y}{2} = \cos^{-1}(x-1)$$

$$x = \cos\left(\frac{y}{2}\right) + 1$$

$$A = \int_0^{2\pi} \left[\cos\left(\frac{y}{2}\right) + 1 \right] dy$$

$$= \left[2\sin\frac{y}{2} + y \right]_0^{2\pi}$$

$$= 2\sin\pi + 2\pi - 2\sin 0 - 0$$

$$= 2\pi \text{ units}^2$$

① expression for x

① expression for area

① integration

① evaluation of definite integral.

Method 2 :- Using symmetry

Graph of $y = 2\cos^{-1}(x-1)$ is symmetrical about point $(1, \pi)$.

$$\therefore A_1 = A_2$$

$$\therefore A_1 = \frac{1}{2} \text{ of Area of PQRO}$$

$$= \frac{1}{2} \times 2 \times 2\pi$$

$$= 2\pi \text{ units}^2$$

Note: Many students said $A_1 = \text{PQRO} - A_1$ without any explanation of symmetry. This received 3 marks.

Their solution started with:

$$A = 4\pi - \int_0^{2\pi} \left[\cos\left(\frac{y}{2}\right) + 1 \right] dy$$
