Question 12 Solutions

(a)(i) $y = f(|x|)$

(ii) $y = \frac{1}{f(x)}$ $x = -2$

(iii) $y = \tan^{-1} f(x)$

Question 12 Solutions

(b)(i) Let $x + iy = \sqrt{8 - 6i}$

$$(x + iy)^2 = 8 - 6i$$

$$x^2 + 2xyi + y^2i^2 = 8 - 6i$$

$$x^2 - y^2 + 2xyi = 8 - 6i$$

Equating like terms $x^2 - y^2 = 8$ — (1)

$$2xy = -6$$

$$y = -\frac{3}{x} \text{ — (2)}$$

Sub (2) into (1), $x^2 - \left(-\frac{3}{x}\right)^2 = 8$

$$x^2 - \frac{9}{x^2} = 8$$

$$x^4 - 9 = 8x^2$$

$$x^4 - 8x^2 - 9 = 0$$

$$(x^2 - 9)(x^2 + 1) = 0$$

Since x is the real component of the complex number,

$$\therefore x^2 = 9$$

$$\therefore x = \pm 3$$

Sub $x = \pm 3$ into (2), $\therefore y = \mp 1$

$$\therefore \sqrt{8 - 6i} = 3 - i \text{ or } -3 + i$$

(ii) $2z^2 + (1 - 3i)z - 2 = 0$

$$a = 2 \quad b = 1 - 3i \quad c = -2$$

$$z = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$= \frac{-(1 - 3i) \pm \sqrt{(1 - 3i)^2 - 4(2)(-2)}}{2(2)}$$

$$= \frac{-1 + 3i \pm \sqrt{1 - 6i - 9 + 16}}{4}$$

$$= \frac{-1 + 3i \pm \sqrt{8 - 6i}}{4}$$

$$z = \frac{-1 + 3i + (3 - i)}{4} \text{ or } = \frac{-1 + 3i + (-3 + i)}{4}$$

(equiangular)

$$\frac{BE}{BA} = \frac{BA}{BF} \quad (\text{corresponding sides of similar triangles in same ratio})$$

$$\therefore BE \cdot BF = BA^2$$

(ii) Assume $BC^2 = BG \cdot BD$,

$$AB = CB \quad (\text{given})$$

$$AB^2 = CB^2$$

$$BF \cdot BE = BG \cdot BD \quad [\text{from (a) and given}]$$

$$\frac{BG}{BF} = \frac{BE}{BD}$$

In $\triangle BEG$ and $\triangle BDF$,

$$\angle EBG = \angle DBF \quad (\text{common})$$

$$\frac{BG}{BF} = \frac{BE}{BD} \quad (\text{proven above})$$

Question 14 Solutions

(iii) In $\triangle BEG$ and $\triangle BDF$,

(iii) For the particle to remain in contact with the surface of the sphere, then $T > 0$ and $N > 0$ for all the values of ω . Since T is always positive, thus need to consider N .

Hence $N > 0$
 $g \sin \theta - 2a\omega^2 \sin \theta \cos \theta > 0$
 $\sin \theta (g - 2a\omega^2 \cos \theta) > 0$ and since $0^\circ < \theta < 90^\circ$
 $\therefore \sin \theta > 0$
 i.e. $g - 2a\omega^2 \cos \theta > 0$
 $g > 2a\omega^2 \cos \theta$
 $\frac{g}{2a \cos \theta} > \omega^2$
 $\therefore \omega^2 < \frac{g}{2a \cos \theta}$

$$\begin{aligned}\frac{dy}{dx} &= \frac{dy}{dt} \times \frac{dt}{dx} \\ &= -\frac{c}{t^2} \times \frac{1}{c} \\ &= -\frac{1}{t^2}\end{aligned}$$

Since tangent at $P \perp PQ$, $\therefore m_{PQ} = t^2$

$$\tan \theta = \left| \frac{m_{PQ} - m_{OQ}}{1 + m_{PQ} \times m_{OQ}} \right|$$

$$\therefore \tan \theta = \left| \frac{t^2 - 1}{1 + t^2} \right| \quad (\text{as required})$$

(ii) $m_{PO} = \frac{\frac{c}{t} - 0}{ct - 0}$

$$\therefore \tan \angle POQ = \tan \theta \quad (\text{as required})$$

(iii) $S(c\sqrt{2}, c\sqrt{2})$

If $PS \perp OQ$, $\therefore m_{PS} = -1$

Hence $\left| \frac{\frac{c}{t} - c\sqrt{2}}{ct - c\sqrt{2}} \right| = -1$

Question 15 Solutions

$$t + \frac{1}{t} = 2\sqrt{2}$$

$$\frac{t^2 + 1}{t} = 2\sqrt{2}$$

Now $\tan \theta = \tan \angle POQ$ from (ii),

$$\begin{aligned} & \frac{t - \frac{1}{t}}{t + \frac{1}{t}} \end{aligned}$$

$$\therefore \tan^2 \theta = \left(\frac{t - \frac{1}{t}}{t + \frac{1}{t}} \right)^2$$

$$\begin{aligned} &= \frac{t^2 - 2 + \frac{1}{t^2}}{\left(t + \frac{1}{t} \right)^2} \end{aligned}$$

$$\begin{aligned} &= \frac{\left(t^2 + 2 + \frac{1}{t^2} \right) - 2 - 2}{\left(t + \frac{1}{t} \right)^2} \end{aligned}$$

$$\begin{aligned} &= \frac{\left(t + \frac{1}{t} \right)^2 - 4}{\left(t + \frac{1}{t} \right)^2} \end{aligned}$$

$$\begin{aligned} &= \frac{(2\sqrt{2})^2 - 4}{(2\sqrt{2})^2} \end{aligned}$$

$$\begin{aligned} &= \frac{8 - 4}{8} = \frac{1}{2} \end{aligned}$$

$$\therefore \tan \theta = \frac{1}{\sqrt{2}} \quad (\theta \geq 0) \quad (\text{as required})$$

Question 16 Solutions

$$\begin{aligned}
& \text{(a)(i)} \quad (\cos \theta + i \sin \theta)^5 \\
&= \cos^5 \theta + 5 \cos^4 \theta (i \sin \theta) + 10 \cos^3 \theta (i \sin \theta)^2 \\
&\quad + 10 \cos^2 \theta (i \sin \theta)^3 + 5 \cos \theta (i \sin \theta)^4 + (i \sin \theta)^5 \\
&= \cos^5 \theta + 5i \cos^4 \theta \sin \theta + 10 \cos^3 \theta (i^2) \sin^2 \theta \\
&\quad + 10 \cos^2 \theta (i^3) \sin^3 \theta + 5 \cos \theta (i^4) \sin^4 \theta + (i^5) \sin^5 \theta \\
&= \cos^5 \theta + 5i \cos^4 \theta \sin \theta + 10 \cos^3 \theta (-1) \sin^2 \theta \\
&\quad + 10 \cos^2 \theta (-i) \sin^3 \theta + 5 \cos \theta (1) \sin^4 \theta + (i) \sin^5 \theta \\
&= \cos^5 \theta + 5i \cos^4 \theta \sin \theta - 10 \cos^3 \theta \sin^2 \theta \\
&\quad - 10i \cos^2 \theta \sin^3 \theta + 5 \cos \theta \sin^4 \theta + i \sin^5 \theta
\end{aligned}$$

And by De Moivre's Theorem,

$$(\cos \theta + i \sin \theta)^5 = \cos 5\theta + i \sin 5\theta$$

Equating the real terms:

$$\begin{aligned}
\cos 5\theta &= \cos^5 \theta - 10 \cos^3 \theta \sin^2 \theta + 5 \cos \theta \sin^4 \theta \\
&= \cos^5 \theta - 10 \cos^3 \theta \sin^2 \theta + 5 \cos \theta (\sin^2 \theta)^2 \\
&= \cos^5 \theta - 10 \cos^3 \theta (1 - \cos^2 \theta) + 5 \cos \theta (1 - \cos^2 \theta)^2 \\
&= \cos^5 \theta - 10 \cos^3 \theta + 10 \cos^5 \theta \\
&\quad + 5 \cos \theta (1 - 2 \cos^2 \theta + \cos^4 \theta) \\
&= \cos^5 \theta - 10 \cos^3 \theta + 10 \cos^5 \theta + 5 \cos \theta - 10 \cos^3 \theta \\
&\quad + 5 \cos^5 \theta \\
\therefore \cos 5\theta &= 16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta \quad (\text{as required})
\end{aligned}$$

$$\begin{aligned}
& \text{(ii)} \quad \text{Let} \quad \cos 5\theta = 0 \\
& 16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta = 0 \quad \text{and let } x = \cos \theta
\end{aligned}$$

$$16x^5 - 20x^3 + 5x = 0$$

$$x(16x^4 - 20x^2 + 5) = 0$$

$$x = 0 \quad \text{or} \quad 16x^4 - 20x^2 + 5 = 0$$

The roots of x can be obtained from $\cos 5\theta = 0$;

$$5\theta = 2k\pi + \frac{\pi}{2} \quad \text{where } k = 0, 1, 2, 3, 4$$

$$5\theta = \frac{4k\pi + \pi}{2}$$

$$\therefore \theta = \frac{4k\pi + \pi}{10}$$

$$\text{When } k = 0, \quad \theta = \frac{\pi}{10}, \quad x_1 = \cos \frac{\pi}{10}$$

$$k = 1, \quad \theta = \frac{\pi}{2}, \quad x_2 = 0$$

$$k = 2, \quad \theta = \frac{9\pi}{10}, \quad x_3 = \cos \frac{9\pi}{10} = -\cos \frac{\pi}{10}$$

Question 16 Solutions

$$(a)(ii) \text{cont.} \quad k=3, \quad \theta = \frac{13\pi}{10}, \quad x_4 = \cos \frac{13\pi}{10} = -\cos \frac{3\pi}{10}$$
$$k=4, \quad \theta = \frac{17\pi}{10}, \quad x_5 = \cos \frac{17\pi}{10} = \cos \frac{3\pi}{10}$$

$\therefore 16x^4 - 20x^2 + 5 = 0$ has 4 non-zero roots are

$$\cos \frac{\pi}{10}, -\cos \frac{\pi}{10}, \cos \frac{3\pi}{10} \text{ and } -\cos \frac{3\pi}{10}.$$

$$(iii) \quad 16x^4 - 20x^2 + 5 = 0$$

$$x_1 x_3 x_4 x_5 = \frac{e}{a} \text{ where } e=5 \text{ and } a=16$$

$$x_1 x_3 x_4 x_5 = \frac{5}{16}$$

$$\cos \frac{\pi}{10} \left(-\cos \frac{\pi}{10} \right) \cos \frac{3\pi}{10} \left(-\cos \frac{3\pi}{10} \right) = \frac{5}{16}$$

$$\left(\cos \frac{\pi}{10} \cos \frac{3\pi}{10} \right)^2 = \frac{5}{16}$$

$$\therefore \cos \frac{\pi}{10} \cos \frac{3\pi}{10} = \frac{\sqrt{5}}{4} \quad \text{since } \cos \frac{\pi}{10} > 0$$

$$\text{and } \cos \frac{3\pi}{10} > 0$$

$$(iv) \quad \sin \frac{3\pi}{5} \sin \frac{6\pi}{5} = \cos \left(\frac{\pi}{2} - \frac{3\pi}{5} \right) \cos \left(\frac{\pi}{2} - \frac{6\pi}{5} \right)$$
$$= \cos \left(\frac{5\pi - 6\pi}{10} \right) \cos \left(\frac{5\pi - 12\pi}{10} \right)$$
$$= \cos \left(\frac{-\pi}{10} \right) \cos \left(\frac{7\pi}{10} \right)$$
$$= \cos \frac{\pi}{10} \left(-\cos \frac{3\pi}{10} \right)$$
$$= - \left(\cos \frac{\pi}{10} \cos \frac{3\pi}{10} \right)$$

$$\therefore \sin \frac{3\pi}{5} \sin \frac{6\pi}{5} = -\frac{\sqrt{5}}{4}$$

$$(b)(i) \quad \underline{\text{To prove:}} \quad \cos(\alpha + \beta) + \cos(\alpha - \beta) = 2 \cos \alpha \cos \beta$$

$$\underline{\text{Proof:}} \quad \text{LHS} = \cos(\alpha + \beta) + \cos(\alpha - \beta)$$

$$= \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$+ \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$= 2 \cos \alpha \cos \beta$$

$$\therefore \text{LHS} = \text{RHS} \quad (\text{QED})$$
