 $\frac{\pi^2}{2}$.

9.

z lies on the circumference of a circle, radii from α and β meet at the centre at $\frac{\pi}{2}$ radians. This means the angle at z must be $\frac{\pi}{4}$ radians as the angle at the circumference is half the angle at the centre when subtended by the same arc.

OR

$z - \alpha$ represents the vector from α to z .

$z - \beta$ represents the vector from β to z .

Using the exterior angle of a triangle, we can see that the angle at $z = \text{Arg}(z - \alpha) - \text{Arg}(z - \beta)$

So, $\text{Arg}(z - \alpha) - \text{Arg}(z - \beta) = \frac{\pi}{4}$

Hence, the correct option is B.

(B)

Then $d = -\left(\frac{ap}{a}\right)^2 = -p^2$ Also, the given equation $x^4 + ax^3 + bx^2 + cx + d = 0$ becomes $16 + 8a + 2c + d = 0$ since 2 is a root. From $16 + 8a + 2c + d = 0 \Rightarrow d = -2(8 + 4a + c)$ hence d is even as it divisible by 2 and 8, 4, a, c are integral. Since d is even and $d = -p^2$, it follows p must be even and hence $p = 2q \therefore d = -4q^2$ Now from $16 + 8a + 2c + d = 0$ we have $16 + 8a + 2c - 4q^2 = 0$ That is $c = -2(q^2 - 4 - 2a)$ which is even as required as q, a are integral.	① it is divisible by 2 which quite a few stated. i.e α and β etc ① ①

(b)(iv) From part (iii) $J_n - J_{n-1} = (-1)^n \left(\frac{1}{2n-1} \right)$ $\therefore J_m = (J_m - J_{m-1}) + (J_{m-1} - J_{m-2}) + (J_{m-2} - J_{m-3})$ $+ \dots + (J_1 - J_0) + J_0$ $= J_0 + (J_m - J_{m-1}) + (J_{m-1} - J_{m-2}) + (J_{m-2} - J_{m-3})$ $+ \dots + (J_1 - J_0)$ $= J_0 + (J_m - J_{m-1}) + (J_{m-1} - J_{m-2}) + (J_{m-2} - J_{m-3})$ $= J_0 + (-1)^1 \left(\frac{1}{2(1)-1} \right) + (-1)^2 \left(\frac{1}{2(2)-1} \right)$ $+ (-1)^3 \left(\frac{1}{2(3)-1} \right) + \dots + (-1)^m \left(\frac{1}{2m-1} \right) \quad \textcircled{1}$ $= (-1)^0 I_{2(0)} + \sum_{n=1}^m (-1)^n \left(\frac{1}{2n-1} \right) \quad \textcircled{1}$ $= I_0 + \sum_{n=1}^m \frac{(-1)^n}{2n-1}$	Mostly did well. Easy question to show since the series for J_m. Students need to show the substitution of $J_n - J_{n-1} = (-1)^n \left(\frac{1}{2n-1} \right)$ for the sigma notation, and either show how $J_0 = \frac{\pi}{4}$.

	$\therefore J_m = \frac{\pi}{4} + \sum_{n=1}^m \frac{(-1)^n}{2n-1} \quad (\text{as required})$

16.	(b)(vi) From (i) $I_n + I_{n+2} = \frac{1}{n+1}$. Since $I_n = \int_0^{\frac{\pi}{4}} \tan^n x \, dx > 0$, and $I_{n+2} = \int_0^{\frac{\pi}{4}} \tan^{n+2} x \, dx > 0$ Then $I_n < \frac{1}{n+1}$ and $I_{n+2} < \frac{1}{n+1}$ Hence $0 < I_n < \frac{1}{n+1}$. ① As $\lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$ i.e. $\lim_{n \rightarrow \infty} I_n = 0$ and $\lim_{n \rightarrow \infty} I_{2n} = 0$ and $\lim_{n \rightarrow \infty} J_n = \lim_{n \rightarrow \infty} (-1)^n I_{2n}$ ① $\therefore \lim_{n \rightarrow \infty} J_n = 0 \quad (\text{and } \frac{\pi}{4} + \sum_{n=1}^m \frac{(-1)^n}{2n-1} = 0)$ $\frac{\pi}{4} = - \sum_{n=1}^m \frac{(-1)^n}{2n-1}$	Some students have approached from different perspective and did well. Students that did not give a comprehensive approach for either or both deductions were not awarded the marks.
