Question No. 4 Solutions and Marking Guidelines		
Outcomes Addressed in this Question		
E4	uses efficient techniques for the algebraic manipulation required in dealing with questions such as those involving conic sections and polynomials	
Outcome	Solutions	Marking Guidelines
E4 (a) (i)	For $P(x)$ to have a zero with multiplicity of 3, we can write $P(x)$ as $P(x) = (x - a)^3 Q(x)$ where $Q(x) \neq 0$. Differentiating $P(x)$ gives $P'(x) = (x - a)^3 Q'(x) + 3(x - a)^2 Q(x)$ $= (x - a)^2 [(x - a)Q'(x) + 3Q(x)]$ $= (x - a)^2 R(x)$ where $R(x) \neq 0$. So $P(x)$ has a zero of multiplicity 2.	Correct solution 2 Substantially correct solution 1
E4 (a) (ii)	Let $P(x) = 8x^4 - 25x^3 + 27x^2 - 11x + 1$ and let $x = \alpha$ be the zero of multiplicity 3. Differentiating $P'(x) = 32x^3 - 75x^2 + 54x - 11$ $P''(x) = 96x^2 - 150x + 54$ $= 6(16x^2 - 25x + 9)$ $= 6(x - 1)(16x - 9)$ So the zeros of $P''(x)$ are $x = 1$ and $x = \frac{9}{16}$. Testing $x = 1, P(1) = 0$ and $P'(1) = 0$, so $P(x) = (x - 1)^3 Q(x)$. Let $x = \beta$ be the other zero. $\alpha + \alpha + \alpha + \beta = \frac{25}{8}$ $\beta = \frac{25}{8} - 3\alpha = \frac{25}{8} - 3 = \frac{1}{8}$ So, the zeros of $P(x) = 8x^4 - 25x^3 + 27x^2 - 11x + 1$ are $x = 1, 1, 1, \frac{1}{8}$.	Correct solution 2 Substantially correct solution 1
E4 (a) (iii)		Correct solution 1

E4 (b) (i)	$\cos 5\theta = -1$ $\therefore 5\theta = 2n\pi + \pi = (2n+1)\pi$ for $n = 0, \pm 1, \pm 2, \dots$ $\therefore \theta = (2n+1)\frac{\pi}{5}$ for $n = 0, \pm 1, \pm 2, \dots$ For $0 \leq \theta \leq 2\pi$, $\theta = \frac{\pi}{5}, \frac{3\pi}{5}, \frac{7\pi}{5}, \frac{9\pi}{5}$	Correct solution 2 Determination of general solution only 1 OR Particular solution only 1
E4 (b) (ii)	Using the binomial expansion, $\operatorname{Re}\{(\cos \theta + i \sin \theta)^5\}$ $= \cos^5 \theta + 10 \cos^3 \theta (i \sin \theta)^2 + 5 \cos \theta (i \sin \theta)^4$ $= \cos^5 \theta - 10 \cos^3 \theta \sin^2 \theta + 5 \cos \theta \sin^4 \theta$ $= \cos^5 \theta - 10 \cos^3 \theta (1 - \cos^2 \theta) + 5 \cos \theta (1 - \cos^2 \theta)^2$ $= 16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta$ Using De Moivre's Theorem $(\cos \theta + i \sin \theta)^5 = \cos 5\theta + i \sin 5\theta$ Hence, $\cos 5\theta = 16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta$	Correct solution 3 Determination of $\operatorname{Re}\{(\cos \theta + i \sin \theta)^5\}$ in terms of $\cos \theta$ only 2 Determination of $\operatorname{Re}\{(\cos \theta + i \sin \theta)^5\}$ in terms of $\cos \theta$ and $\sin \theta$ 1 OR Correct use of De Moivre's Theorem 1
E4 (b) (iii)	In the given equation let $x = \cos \theta$. The equation becomes $16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta + 1 = 0$. This can be written as $\cos 5\theta + 1 = 0$, ∴ $\cos 5\theta = -1$ ∴ $\theta = \frac{\pi}{5}, \frac{3\pi}{5}, \frac{7\pi}{5}, \frac{9\pi}{5}$ ∴ $x = \cos \frac{\pi}{5}, \cos \frac{3\pi}{5}, \cos \pi, \cos \frac{7\pi}{5}, \cos \frac{9\pi}{5}$ ∴ $x = \cos \frac{\pi}{5}, \cos \frac{3\pi}{5}, -1, \cos \left(-\frac{3\pi}{5}\right), \cos \left(-\frac{\pi}{5}\right)$ ∴ $x = \cos \frac{\pi}{5}, \cos \frac{3\pi}{5}, \cos \frac{3\pi}{5}, \cos \frac{\pi}{5}, -1$	Correct solution 2 Substantially correct solution 1
E4 (b) (iv)	Sum of roots = 0 $2 \left(\cos \frac{\pi}{5} + \cos \frac{3\pi}{5} \right) - 1 = 0$ $\therefore \cos \frac{\pi}{5} + \cos \frac{3\pi}{5} = \frac{1}{2}$	Correct solution 3 Correct values for $\cos \frac{\pi}{5} + \cos \frac{3\pi}{5}$ and $\cos \frac{\pi}{5} \times \cos \frac{3\pi}{5}$ only 2 OR Reasonable attempt at factorisation based upon values of $\cos \frac{\pi}{5} + \cos \frac{3\pi}{5}$ and $\cos \frac{\pi}{5} \times \cos \frac{3\pi}{5}$ 2

(a)(i) PE3	$\int_n^{2n} \frac{dx}{\sqrt{x}} = \left[2\sqrt{x} \right]_n^{2n}$ $= 2\sqrt{2n} - 2\sqrt{n}$ $= 2\sqrt{n}(\sqrt{2}-1)$	2 marks : correct solution 1 mark : substantially correct.
(a)(ii)(a) PE3	The upper rectangles have area greater than the integral, so $\int_n^{2n} \frac{dx}{\sqrt{x}} < \frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n+1}} + \dots + \frac{1}{\sqrt{2n-1}}$ Adding $\frac{1}{\sqrt{2n}} - \frac{1}{\sqrt{n}}$ to both sides, and using (i) gives $2\sqrt{n}(\sqrt{2}-1) + \frac{1}{\sqrt{2n}} - \frac{1}{\sqrt{n}} < \frac{1}{\sqrt{n+1}} + \frac{1}{\sqrt{n+2}} + \dots + \frac{1}{\sqrt{2n}}$... ① The lower rectangles have area less than the integral, so $\frac{1}{\sqrt{n+1}} + \frac{1}{\sqrt{n+2}} + \dots + \frac{1}{\sqrt{2n}} < \int_n^{2n} \frac{dx}{\sqrt{x}}$ ie $\frac{1}{\sqrt{n+1}} + \frac{1}{\sqrt{n+2}} + \dots + \frac{1}{\sqrt{2n}} < 2\sqrt{n}(\sqrt{2}-1)$... ② From ① and ② we get $2\sqrt{n}(\sqrt{2}-1) + \frac{1}{\sqrt{2n}} - \frac{1}{\sqrt{n}} < S_n < 2\sqrt{n}(\sqrt{2}-1)$ ie $2\sqrt{n}(\sqrt{2}-1) + \frac{1-\sqrt{2}}{\sqrt{2n}} < S_n < 2\sqrt{n}(\sqrt{2}-1)$	4 marks : Establishes result 3 marks : Substantially correct - Derives inequalities ① and ② (or equivalent) without final inequality 2 marks : Partially correct - eg, establishing $S_n < \int_n^{2n} \frac{dx}{\sqrt{x}}$ 1 mark : establishing one inequality correctly.
(a)(ii)(b) PE3	When $n = 10^8$, $S_n \approx 8284.2712$ on substitution into result from (ii)(a)	1 mark : correct result

(b)(i) PE3	$\angle AET = \angle ADB$ $\angle ADB = \angle FAT$ $\therefore \angle AET = \angle FAT$ Also, $\angle ATF = \angle ETA$ So, $\triangle TFA \parallel \triangle TAE$	(corresponding, $CT \parallel DB$) ($\angle$ between chord and tangent equals $\angle$ in alternate segment) (both = $\angle ADB$) (common) (equiangular)	2 marks : writes correct argument. 2 marks : incomplete, but relevant argument. 1 mark : recognises relevant data without constructing an argument.
(b)(ii) PE3	$\frac{TA}{TE} = \frac{TF}{TA}$ $\therefore TE \cdot TF = TA^2$ But $TA = TB$ $\therefore TE \cdot TF = TB^2$	[scale of ratios of similar Δ 's in (i)] (tangents from an external point are equal)	2 marks : writes correct argument. 1 mark : incomplete, but relevant argument.
(b)(iii) PE3	$\angle BTE = \angle FTB$ $\frac{TE}{TB} = \frac{TB}{TF}$ $\therefore \triangle EBT \parallel \triangle BFT$	(common) (from (i)) (2 pairs of corresponding sides are in proportion and their included angles are equal)	2 marks : writes correct argument. 1 mark : incomplete, but relevant argument.
(b)(iv) PE3	$\angle EDB = \angle FBT$ $\angle FBT = \angle BET$ $\angle BET = \angle EBD$ $\therefore \angle EDB = \angle EBD$ $\therefore \triangle DEB$ is isosceles (base angles equal)	($\angle$ between chord and tangent equals $\angle$ in alternate segment) (corresponding, $\triangle EBT \parallel \triangle BFT$) (alternate, $CT \parallel DB$)	1 mark : writes correct argument.
