$$\sqrt{3} \cos x - \sin x = A \cos(x + \alpha)$$

$$= 2(\cos x \cos \alpha - \sin x \sin \alpha)$$

$$A = \sqrt{(\sqrt{3})^2 + (-1)^2}$$

$$= 2$$

$$\therefore \sqrt{3} \cos x = 2 \cos x \cos \alpha$$

$$\cos \alpha = \frac{\sqrt{3}}{2}$$

$$-\sin x = -2 \sin x \sin \alpha$$

$$\sin \alpha = \frac{1}{2}$$

$$\therefore \alpha = \pi/6$$

$$\therefore \sqrt{3} \cos x - \sin x = 2 \cos(x + \pi/6)$$

$$2 \cos(x + \pi/6) = -1$$

$$\cos(x + \pi/6) = -1/2$$

Let the statement be $4^n + 14$ is divisible by 6 for all $n \geq 1$

When $n=1$

$4^1 + 14 = 18$ which is divisible by 6

Assume the statement is true for $n=k$

i.e. $4^k + 14 = 6M$ $M \in \mathbb{Z}$, $k \geq 1$

RTP the statement is true for $n=k+1$

i.e. $4^{k+1} + 14$ is divisible by 6

Now $4^{k+1} + 14$

$$= 4 \times 4^k + 14$$

From assumption, $4^k = 6M - 14$

Substituting

$$\therefore = 4 \times (6M - 14) + 14$$

$$= 24M - 56 + 14$$

$$= 24M - 42$$

$$= 6(4M - 7)$$

Since $M \in \mathbb{Z}$, $4M - 7 \in \mathbb{Z} \therefore 4^{k+1} + 14$ is divisible by 6

Hence, since the statement is true for $n=1, k$ and $n=k+1$, the statement is true for $n=1+1=2$ and so on by the principle of mathematical induction.
