$$\begin{aligned}\therefore \cos \theta &= \frac{1}{2} \\ \theta &= 60^\circ, 300^\circ\end{aligned}$$

Question 15 (Berry)

✓ [1] for doubling area of triangle.

(a) (4 marks)

✓ [1] for each correct value of $\angle RPQ$ and PR .

$$\frac{\sin \angle RPQ}{22} = \frac{\sin 15^\circ}{20}$$

$$\sin \angle RPQ = \frac{22 \sin 15^\circ}{20}$$

$$\angle RPQ = 16^\circ 32' \text{ or } 163^\circ 28'$$

(there are two solutions as the angle to be found is opposite the longer side)

(Not to scale)

Using the angle sum of $\triangle$, $\angle PQR = 148^\circ 28'$ or $1^\circ 32'$.

- When $\angle PQR = 148^\circ 28'$,

$$\frac{PR}{\sin 148^\circ 28'} = \frac{20}{\sin 15^\circ}$$

$$PR = \frac{20 \sin 148^\circ 28'}{\sin 15^\circ}$$

$$= 40.42 \dots$$

- When $\angle PQR = 1^\circ 32'$,

$$\frac{PR}{\sin 1^\circ 32'} = \frac{20}{\sin 15^\circ}$$

$$PR = \frac{20 \sin 1^\circ 32'}{\sin 15^\circ}$$

$$= 2.08 \dots$$

(b) (3 marks)

✓ [1] for correct area of triangle via sine formula.

✓ [1] for area of triangle as exact value.

Area of $\triangle ABD$:

$$A_{\triangle ABD} = \frac{1}{2} \times 5 \times 8 \times \sin 60^\circ$$

$$= 10\sqrt{3}$$

$$\therefore A_{ABCD} = 20\sqrt{3}$$

i. (3 marks)

✓ [1] for correct diagram

✓ [1] for two equations in x , and $503 - x$

✓ [1] for final answer.

Let x be the distance from the souther pylon to the ship (could be from the northern pylon, but this is not important as the solution is identical)

$$\frac{h}{x} = \tan 47^\circ$$

$$\therefore x = \frac{h}{\tan 47^\circ} \quad (15.1)$$

In the ther triangle,

$$\frac{h}{503 - x} = \tan 28^\circ$$

$$\therefore 503 - x = \frac{h}{\tan 28^\circ}$$

$$x = 503 - \frac{h}{\tan 28^\circ} \quad (15.2)$$

Equating x in (15.1) and (15.2)

$$\begin{aligned} 503 - \frac{h}{\tan 28^\circ} &= \frac{h}{\tan 47^\circ} \\ 503 &= \frac{h}{\tan 47^\circ} + \frac{h}{\tan 28^\circ} \\ &= h \left(\frac{1}{\tan 47^\circ} + \frac{1}{\tan 28^\circ} \right) \\ &= h \left(\frac{\tan 28^\circ + \tan 47^\circ}{\tan 28^\circ \tan 47^\circ} \right) \end{aligned}$$

Dividing both sides by $\frac{\tan 28^\circ + \tan 47^\circ}{\tan 28^\circ \tan 47^\circ}$,

$$\therefore h = \frac{503 \tan 28^\circ \tan 47^\circ}{\tan 28^\circ + \tan 47^\circ}$$

ii. (2 marks)

- ✓ [1] for correct number of significant figures.
- ✓ [1] for correct scientific notation.
- ✓ [-1] for metres (required to give cm)

$$h = 178.79 \text{ m} = 1.788 \times 10^4 \text{ cm}$$

Question 16 (Rezcallah)

(a) (2 marks)

- ✓ [1] expanding some terms correctly *or* obtaining one term of the answer correct.
- ✓ [1] correct final answer ([1] only for entire question if no working is provided)

$$(a-5)^2 = a^2 - 10a + 25$$

$$(a+5)^2 = a^2 + 10a + 25$$

$$(a-4)^2 = a^2 - 8a + 16$$

$$(a+4)^2 = a^2 + 8a + 16$$

⋮

Observations

- there will be eleven a^2 terms (including the single $(a+0)^2$ expansion)
- all a terms are offset;
- Constant term produces double of sum of squares $-2(1^2 + 2^2 + \dots + 5^2)$

$$\begin{aligned} \therefore (a-5)^2 + \dots + a^2 + \dots + (a+5)^2 \\ = 11a^2 + 110 \end{aligned}$$

(b) (3 marks)

- ✓ [2] for correct equation $\frac{1}{2}b + 3 = (-\frac{1}{6}b + 5) + 1$.
- ✓ [1] for correct final answer.

- Upper part of the roof, at b :

$$h = \frac{1}{2}b + 3$$

- Lower part of the roof, at b :

$$h = -\frac{1}{6}b + 5$$

- Relating the upper and lower part (these parts differ by 1 m):

$$\frac{1}{2}b + 3 = \left(-\frac{1}{6}b + 5 \right) + 1$$

$$\underbrace{\frac{1}{2}b + 3}_{\times 6} = \underbrace{-\frac{1}{6}b + 6}_{\times 6}$$

$$3b + 18 = -b + 36$$

$$4b = 18$$

$$\therefore b = \frac{9}{2}$$

$$\therefore \alpha + \beta = 45^\circ$$

$$\therefore \alpha + \beta = \gamma$$
