$$3 \sec^2 \theta - 5 \sec \theta - 2 = 0$$

$$(3 \sec \theta + 1)(\sec \theta - 2) = 0$$

thus $\sec \theta = -\frac{1}{3}$ or 2

$\sec \theta = -\frac{1}{3}$ has no real solutions.

$\sec \theta = 2$ has solutions $\theta = 60^\circ$ or 300° .

$$\begin{aligned}
 \text{so } y' &= 1 - \frac{1}{x+1} \\

thus there is a stationary point at $(0, 0)$.

$$y'' = \frac{1}{(x+1)^2}$$

so at $x = 0$, $y'' = 1$ and it is a minimum stationary point.

$$\text{(ii)} \quad y'' > 0 \text{ for all } x \text{ in the domain,}$$

thus y'' never changes sign,

hence the concavity never changes.

(iii)

$$\text{(iv) If } \log(x+1) \geq x$$

$$\text{then } 0 \geq x - \log(x+1)$$

which, from the graph, is only true when $x = 0$.

(b) In this case, areas below the x -axis are negative,

$$\text{area quadrant} = \frac{\pi}{4}$$

$$\text{area triangle} = \frac{1}{2},$$

$$\begin{aligned} \text{hence} \quad \int_2^2 h(x) dx &= -\left(1 - \frac{\pi}{4} + \frac{1}{2}\right) + \left(\frac{1}{2} + \frac{\pi}{4}\right) \\ &= \frac{\pi}{2} - 1 \end{aligned}$$

(c) (i) Since $x^2 + 1 \equiv a(x - 1)^2 + b(x - 1) + c$

$$\text{at } x = 1: \quad 2 = c$$

$$\text{at } x = 2: \quad 5 = a + b + c$$

$$\text{at } x = 0: \quad 1 = a - b + c$$

solving simultaneously,

$$a = 1$$

$$\text{and} \quad b = 2$$

(ii) From part (i):

$$\begin{aligned} \int \frac{x^2 + 1}{(x - 1)^2} dx &= \int \frac{(x - 1)^2 + 2(x - 1) + 2}{(x - 1)^2} dx \\ &= \int 1 + \frac{2}{x - 1} + \frac{2}{(x - 1)^2} dx \\ &= x + 2 \log(x - 1) - \frac{2}{x - 1} + C \end{aligned}$$

QUESTION NINETEEN (13 marks)

(a) (i) $y = mx - 4(m + 1)$

[or equivalent.]

(ii) Substitute $y = \frac{2}{x}$ into part (i) to get:

$$\frac{2}{x}mx - 4(m + 1)$$

$$\text{or} \quad mx^2 - 4(m + 1)x - 2 = 0$$

$\Delta = 0$ since the two are tangent, so:

$$16(m + 1)^2 + 8m = 0$$

$$\text{or} \quad 2m^2 + 5m + 2 = 0$$

$$\text{so} \quad (2m + 1)(m + 2) = 0$$

$$\text{thus} \quad m = -\frac{1}{2} \text{ or } -2.$$

(b) $3\left(x + \frac{1}{x}\right)^2 - 16\left(x + \frac{1}{x}\right) + 20 = 0.$

Put $\lambda = \left(x + \frac{1}{x}\right)$ to get:

$$3\lambda^2 - 16\lambda + 20 = 0$$

or $(3\lambda - 10)(\lambda - 2) = 0$ (or equivalent.) ☒

thus $\lambda = 2$ or $\frac{10}{3}.$ ☒

When $\lambda = 2$ $x + \frac{1}{x} = 2$

$$x^2 - 2x + 1 = 0$$

so $x = 1.$ ☒

When $\lambda = \frac{10}{3}$ $x + \frac{1}{x} = \frac{10}{3}$

$$3x^2 - 10x + 3 = 0$$

$$(3x - 1)(x - 3) = 0$$

so $x = 3$ or $\frac{1}{3}.$ ☒

(c) $I = \int \frac{2x}{\sqrt{x^2 + 1}} dx$
 $= 2 \int \frac{x}{\sqrt{x^2 + 1}} dx$
 $= 2\sqrt{x^2 + 1} + C$

(d) $a(r^2 + r + 1) = 26$

$$a(r + 1) = 8$$

Dividing the first by the second:

$$\frac{r^2 + r + 1}{r + 1} = \frac{13}{4}$$

so $4r^2 + 4r + 4 = 13r + 13$

or $4r^2 - 9r - 9 = 0$

thus $(4r + 3)(r - 3) = 0$

hence $r = -\frac{3}{4}$ or 3 ☒

QUESTION TWENTY (13 marks)

(a) (i) $y = \log x$

so $y' = \frac{1}{x}$

and $y'(a) = \frac{1}{a}$

Thus the tangent has equation:

$$y = \frac{1}{a}x + \log a - 1 \quad (\text{or equivalent})$$

(ii) At the origin:

$$0 = \log a - 1$$

so $\log a = 1$

or $a = e$.

(b) There is a stationary point at $x = -1$ where $f'(x) = 0$.

Since the sign of f' changes from positive to negative,

it is a maximum stationary point (local maximum).

(c) $p^3 + q^3 = (p + q)(p^2 - pq + q^2)$

(d) (i) $(\alpha) \quad p + q = \frac{-b}{a}$
 $\quad \quad \quad = \frac{3}{2}$

$(\beta) \quad pq = \frac{c}{a}$
 $\quad \quad \quad = -2$

$(\gamma) \quad p^3 + q^3 = (p + q)((p + q)^2 - 3pq)$
 $\quad \quad \quad = \frac{99}{8}$

(ii) $(pq)^3 = -8$, so an equation with those roots is

$$x^2 - \frac{99}{8}x - 8 = 0$$

hence $8x^2 - 99x - 64 = 0$.

(e)
$$\begin{aligned} F(x) - F(-x) &= \int_0^x f(t) dt - \int_0^{-x} f(t) dt \\ &= \int_0^x f(t) dt + \int_{-x}^0 f(t) dt \quad (\text{reversing the direction}) \\ &= \int_{-x}^x f(t) dt \quad (\text{combining regions}) \\ &= 2 \int_0^x f(t) dt \\ &= 2F(x). \end{aligned}$$

Hence $-F(-x) = F(x)$,

that is, $F(x)$ is odd.

QUESTION TWENTY ONE (13 marks)

(a) (i) $f'(x) = \begin{cases} 2e^{2x} & \text{for } x < 0 \\ 2ax + b & \text{for } x > 0 \end{cases}$ ☒

(ii) $f(x)$ is continuous so $f(0) = \lim_{x \rightarrow 0^-} f(x)$

i.e. $c = 1$ ☒

$f(x)$ is differentiable so $\lim_{x \rightarrow 0^-} f'(x) = \lim_{x \rightarrow 0^+} f'(x)$

i.e. $2 = b$ ☒

$f(1) = 0$ so

$a + b + c = 0$

thus $a = -3$ ☒

(iii)

[Vertex coordinates may be omitted.] ☒

(iv) The global maximum is at the vertex of the parabola, where $x = \frac{1}{3}$

thus $f_{\max} = \frac{4}{3}$ ☒

(b) (i) $a^x = e^{x \log a}$ ☒

(ii) $y = a^x$

$= e^{x \log a}$

so $y' = e^{x \log a} \times \log a$

$= a^x \log a$ ☒

(c) For $g(x) = a^x - x^a$

(i) $g(0) = a^0 - 0^a \quad (a > 0)$

$= 1$ ☒

(ii) $g'(x) = a^x \log a - ax^{a-1}$ (by part (i))

so $g'(a) = a^a \log a - aa^{a-1}$
 $= a^a(\log a - 1).$

Now $a > e$

so $\log a > 1$

hence $g'(a) > 0$.

- (iii) $g(a) = 0$ so $x = a$ is an x -intercept
 $g'(a) > 0$ so there is at least one value $x = c$,
 $c < a$, for which $g(c) < 0$.

But $g(0) = 1$ and $g(x)$ is continuous.

Thus $g(x)$ changes sign between c and 0 .

Hence $g(x)$ must have another x -intercept.

[Or any other valid argument.]

- (iv) It follows that $g'(b) < 0$.

now $g'(b) = a^b \log a - ab^{a-1}$

$$= a^b \log a - \frac{a}{b} \times b^a$$

$$= a^b \log a - \frac{a}{b} \times a^b \quad (\text{since } g(b) = 0)$$

$$= a^b \left(\log a - \frac{a}{b} \right)$$

thus $\log a - \frac{a}{b} < 0$

hence $b < \frac{a}{\log a}$
