Question 11 ()

- (a) i. (2 marks)

✓ [1] for $p^3 = (2m+1)^3$.

✓ [1] for final conclusion with reasons

Assume p is odd. Then $\exists m \in \mathbb{Z}^+$ such that $p = 2m + 1$.

$$\begin{aligned} p^3 &= (2m+1)^3 \\ &= 8m^3 + 12m^2 + 6m + 1 \\ &= 2(4m^3 + 6m^2 + 3m) + 1 \\ &= 2N + 1, \text{ where } N = 4m^3 + 6m^2 + 3m \end{aligned}$$

such that $N \in \mathbb{Z}^+$. Hence p^3 is odd, which is a contradiction.

$\therefore$ If p^3 is even then p is even.

- ii. (3 marks)

✓ [1] for cubing to get $2 = \frac{p^3}{q^3}$

✓ [1] for deducing q is even

✓ [1] for final conclusion with reasons

Assume $\sqrt[3]{2}$ is rational.

$$\begin{aligned} \sqrt[3]{2} &= \frac{p}{q}, \text{ where } p \text{ and } q \text{ are co-prime} \\ 2 &= \frac{p^3}{q^3} \\ 2q^3 &= p^3 \end{aligned}$$

If p^3 is even, then p is even (proven in (i)).

Then $\exists k \in \mathbb{Z}$ such that $p = 2k$.

$$\begin{aligned} 2q^3 &= (2k)^3 \\ 2q^3 &= 8k^3 \\ q^3 &= 4k^3 \end{aligned}$$

$\therefore q^3$ is even, then q is even.

Since both p and q are even they are not co-prime, which is a contradiction.

$\therefore \sqrt[3]{2}$ is irrational.

- (b) (3 marks)

✓ [1] for explaining why $n = 3k + 1$

✓ [1] for getting $n^3 + (n+1)^3$

✓ [1] for final conclusion with reasons

Since neither n nor $n + 1$ is divisible by 3, $\exists k \in \mathbb{Z}^+$ such that $n = 3k + 1$ or $n = 3k + 2$.

$\therefore$ If $n = 3k + 2$ then $n + 1 = 3k + 3$, which is divisible by 3.

Thus n and $n + 1$ must be of the form $3k + 1$ and $3k + 2$ respectively.

$$\begin{aligned} n^3 + (n + 1)^3 &= [n + (n + 1)](n^2 - n(n + 1) + (n + 1)^2) \\ &= (2n + 1)(n^2 + n + 1) \\ &= (6k + 3)(6k^2 + 12k + 4 + 3k + 2 + 1) \\ &= (6k + 3)(6k^2 + 15k + 9) \\ &= 9(2k + 1)(2k^2 + 5k + 3) \end{aligned}$$

which is divisible by 9, since $2k + 1, 2k^2 + 5k + 3 \in \mathbb{Z}$.

(c) i. (4 marks)

✓ [1] for proving the base case.

✓ [2] for the inductive hypothesis, and for progress in using recurrence relation.

✓ [1] for final conclusion.

Let $P(n)$ be the proposition

- Base case: $P(1)$:

$$\begin{array}{ll} \text{LHS} & x_1 = 1 \\ \text{RHS} & 2 \left(\frac{1 + \left(-\frac{1}{3}\right)}{1 - \left(-\frac{1}{3}\right)} \right) = 2 \left(\frac{\frac{2}{3}}{\frac{4}{3}} \right) = 1 \end{array}$$

Hence $P(1)$ is true.

- Inductive step: assume $P(k)$ is true, $k \in \mathbb{Z}^+$:

$$x_k = 2 \left(\frac{1 + \alpha^k}{1 - \alpha^k} \right) \quad \forall k \in \mathbb{Z}^+$$

Prove $P(k+1)$ is true:

$$\begin{aligned}
 x_{k+1} &= \frac{4+x_k}{1+x_k} \\
 &= \frac{4+2\left(\frac{1+\alpha^k}{1-\alpha^k}\right)}{1+2\left(\frac{1+\alpha^k}{1-\alpha^k}\right)} \quad \dots \text{from the assumption} \\
 &= \frac{4-4\alpha^k+2+2\alpha^k}{1-\alpha^k+2+2\alpha^k} \\
 &= \frac{6-2\alpha^k}{3+\alpha^k} \\
 &= \frac{6\left(1-\frac{\alpha^k}{3}\right)}{3\left(1+\frac{\alpha^k}{3}\right)} \\
 &= \frac{2\left(1+\left(-\frac{1}{3}\right)\alpha^k\right)}{\left(1-\left(-\frac{1}{3}\right)\alpha^k\right)} \\
 &= 2\left(\frac{1+\alpha^{k+1}}{1-\alpha^{k+1}}\right)
 \end{aligned}$$

$\therefore P(k+1)$ is true.

By Mathematical induction, $P(n)$ is true for $n \in \mathbb{Z}^+$ where $n \geq 1$.

ii. (1 mark)

As $\alpha^n \rightarrow 0$ as $n \rightarrow \infty$, $x_n \rightarrow 2$.

(d) i. (2 marks)

✓ [1] for $ab \leq 9$

✓ [1] for showing the final result

If $a+b=6$,

$$\begin{aligned}
 \therefore a^2 + b^2 &\geq 2ab \\
 (a+b)^2 &\geq 4ab \\
 6^2 &\geq 4ab \\
 ab &\leq 9 \\
 \frac{1}{ab} &\geq \frac{1}{9} \\
 \therefore \frac{1}{a} + \frac{1}{b} &= \frac{a+b}{ab} \geq \frac{6}{9} = \frac{2}{3}
 \end{aligned}$$

ii. (2 marks)

✓ [1] for $\frac{1}{ab} \geq \frac{4}{c^2}$

✓ [1] for showing the final result

If $a + b = c$,

$$\begin{aligned}\therefore (a + b)^2 &\geq 4ab \\ c^2 &\geq 4ab \\ \frac{1}{ab} &\geq \frac{4}{c^2} \\ \therefore \frac{1}{a^2} + \frac{1}{b^2} &= \frac{a^2 + b^2}{(ab)^2} \\ &\geq \frac{2ab}{(ab)^2} \\ &= \frac{2}{ab} \\ &\geq 2 \left(\frac{4}{c^2} \right) \\ &= \frac{8}{c^2}\end{aligned}$$

Question 12 ()

(a) i. (1 mark)

$$\begin{aligned}
 \overrightarrow{AB} &= \begin{pmatrix} -5 \\ 4 \\ -1 \end{pmatrix} - \begin{pmatrix} 1 \\ -2 \\ 3 \end{pmatrix} \\
 &= \begin{pmatrix} -6 \\ 6 \\ -4 \end{pmatrix} \\
 &= 2 \begin{pmatrix} -3 \\ 3 \\ -2 \end{pmatrix}
 \end{aligned}$$

$\therefore$ A vector equation is $\underline{r} = \begin{pmatrix} 1 \\ -2 \\ 3 \end{pmatrix} + \lambda \begin{pmatrix} -3 \\ 3 \\ 2 \end{pmatrix}$, where $\lambda \in \mathbb{R}$.

ii. (3 marks)

✓ [1] for setting up three pairs of equations.

✓ [1] for values of λ and μ

✓ [1] for showing the lines are skew by substitution

$$\underline{r}_1 = \begin{pmatrix} 1 - 3\lambda \\ -2 + 3\lambda \\ 3 - 2\lambda \end{pmatrix} \text{ and } \underline{r}_2 = \begin{pmatrix} 1 - \mu \\ 2 + 3\mu \\ -1 + \mu \end{pmatrix}$$

$$\begin{cases} 1 - 3\lambda = 1 - \mu & \dots(1) \\ -2 + 3\lambda = 2 + 3\mu & \dots(2) \\ 3 - 2\lambda = 2 + 3\mu & \dots(3) \end{cases}$$

From (1), $\mu = 3\lambda$.

Sub this into (2),

$$-2 + 3\lambda = 2 + 9\lambda$$

$$6\lambda = -4$$

$$\lambda = -\frac{2}{3} \text{ and } \mu = -2$$

Sub these into (3),

$$\text{LHS} = 3 - 2\left(-\frac{2}{3}\right) = \frac{13}{3}$$

$$\text{RHS} = 2 + 3(-2) = -4$$

 $\therefore$ LHS $\neq$ RHS, the lines are skew.

(b) i. (1 mark)

$$\text{radius } r = \sqrt{6^2 + 2^2 + 4^2} = \sqrt{56} = 2\sqrt{14}$$

$$\therefore \text{The vector equation is } \left| \underline{u} - \begin{pmatrix} -3 \\ -5 \\ 10 \end{pmatrix} \right| = 2\sqrt{14}$$

ii. (1 mark)

$$(x+3)^2 + (x+5)^2 + (x-10)^2 = 56$$

iii. (2 marks)

✓ [1] for finding the distance between the two centres

✓ [1] for showing the final result

Distance between the two centres $(-3, -5, 10)$ and $(-9, 4, 7)$ is

$$\sqrt{6^2 + 9^2 + 3^2} = \sqrt{126} = 3\sqrt{14} = \sqrt{14} + 2\sqrt{14}$$

, which is the addition of two radii.

$\therefore S_1$ and S_2 touch each other at a single point.

iv. (3 marks)

✓ [1] for equating the two vector equations

✓ [1] for the quadratic equation

Question 13 (Ham)

(a) (3 marks)

✓ [1] for finding the third root

✓ [1] for value of p .

✓ [1] for value of q .

As $P(x)$ has real coefficients, then any complex roots that appear also have its conjugate appear as a root. Hence, $1+i$ and $1-i$ are roots of $z^3 + pz^2 + qz + 6 = 0$. Let the third root be α .

Product of roots:

$$\begin{aligned}(1+i)(1-i)\alpha &= -6 \\ 2\alpha &= -6 \\ \therefore \alpha &= -3\end{aligned}$$

Sum of roots,

$$\begin{aligned}(1+i) + (1-i) + (-3) &= -p \\ \therefore p &= 1\end{aligned}$$

Sum of product of two roots,

$$\begin{aligned}(1+i)(1-i) - 3(1+i) - 3(1-i) &= q \\ 2 - 6 &= q \\ \therefore q &= -4\end{aligned}$$

Hence roots are $1 \pm i$ and $1 \pm 2i$.
